The present invention describes a library of human polynucleotides comprising the sequences given in AAZ12532 to AAZ1779 Also described is a method of detecting differentially expressed genes correlated with the cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample from a cell suspected of being ancerous, where the gene product is encoded by one of the 548 polynuclectide sequences given in AAZ12522 to AAZ17779. The polynuclectides can be used as a source of primers and probes, which can be used for a variety of purpose, e.g. detection of expression levels, mapping, tissue typing or profiling, forensics, genetic analysis and detection of polymorphisms. Polypeptides encoded by the polynucleotides for experimental, diagnostic and the arrays for diagnostics (which may be used to determine function of an encays for diagnostics (which may be used to determine function of an encay and to detect differences in expression levels between two cells (e.g. to identify abnormal or diseased tissue in a human, to identify a genetic predisposition or susceptibility to a disease such as cancer, The polynucleotides can also be used to screen for and lung cancer. The polynucleotides can also be used to screen for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel human genes and their expression products which are differentially expressed in different cell types.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Escobedo J, Innis MA, Garcia PD, Sudduth-Klinger J; Jises K, Randazzo F, Kennedy GC, Pot D, Kassam A; nanac R, Crkvanjakov R, Diokson M, Drmanac S, Labat I; Kita D, Garcia V, Jones WL, Stache-Crain B;

No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dry primed cDNA libraries. Such ESTs are not wall suited for isolating cDNA sequences con As equences have been obtained, the full 5' UTR is rarely included. Sests are derived from mRNAs with intext 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, S' EST; expressed sequence tag; secreted protein; cDNA isolation; gene therapy; chromosome mapping; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures.
                                                                                                                                                                                                                                                                                                                                                                    0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1.3%; Score 25.6; DB 1; Length 254;

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cutivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS9464 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this electronic format directly from WIPO at the printed specification, but was obtained in electronic format directly from WIPO at the printed sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

Chimeric DNA for optimizing gamma carboxylation of vitamin K-dependent protein useful for treating diseases associated with the protein, comprises sequence encoding propeptide fused to sequence encoding the 

Disclosure; Fig 6Ei-ii; 60pp; English.

Efficient processing and release of mature two-chain factor X into the circulation requires; removal of the signal sequence; formation of circulation requires; removal of the signal sequence; formation of discultide bonds; modification of amino terminal glutamic acid residues; to gamma-carboxyglutamic acid; modification of one aspartic acid; modification of one apparent acid; modification of N- and O-linked oligosaccharides to the activation peptide; removal of an internal tripptide to yield two-chain factor X and removal of the propeptide just prior to secretion, while some of these modifications do not appear essential for factor X function the removal of the signal sequence, propeptide, internal tripeptide and full gamma-carboxylation are all steps which are important requisites for the propential and relative factor X/FXa. Isolated chimeric polymucleotides are described which encode a propeptide fused to a nucleic acid sequence encoding a vitamin X-dependent protein (WDP). The fusion proteins encoded are vitamin X-dependent protein (WDP). The fusion proteins and recombinant cells expressing them are useful for allowiating a WDP to produce a fully gamma-carboxylated which are such in the production of fully gamma-carboxylated mature WDPP, which are broduction of fully gamma-carboxylated mature WDPP, which are broduction of fully gamma-carboxylated mature WDPP, which are broduction of mid WDPP's. This sequence encodes the propertial processing them are useful in the production of fully gamma-carboxylated mature WDPP, which are processing the processing them are processed to the production of mid WDP's. New regulatory elements that control age-related gene expression, useful in gene therapy and for reducing Factor IX expression.

Disclosure; Fig 12; 225pp; English.

The invention relates to nucleic acid sequences which regulate gene expression in an age-related manner and/or in a liver-specific manner. The invention identifies regions of the human factor IX (hFIX) gene, and a region of the human protein C (hPC) gene, which are age-related carginatory sequences. The hFIX age-related regulatory sequences are designated AES' (AAF54016) and AE3' (AAF54017) and are found in the 5' UTR (at position 2164-2165 of AAF54018) and are found in the 5' UTR (at position 2164-2165 of AAF54018) and are found in the 5' UTR (at position 2164-2165 of AAF54018) and are found in the 5' UTR (at position 2164-2165 of AAF54018) and are found in the 5' UTR (at position 2164-2165) and are found in the 5' UTR (at position 2164-2165) are stabiliste hFIX mRNA, and AE3' acting to increase hFIX mRNA levels, over time. AE5' also directs liver-specific expression. The hFC gene age-related regulatory sequence is found in the 5' UTR (AAF54081), and contains two PEA-3 (polyoma virus activator 3) elements 5' GAGGAA-3' and 5'-CAGGAA-3'. The age-related regulatory sequence of the invention, along with their homologues, variance and fragments, may be used in the construction of recombinant expression vectors for the expression of a desired sequence in an age-related fashion in a host coll. Preferred target genes for expression in such age-regulatable expression vectors include those encoding proteins involved in blood anti-coagulants protein and areporter proteins such as luciferase.

10664775-3.rng

```
Preferred promoters for use in such age-regulatable expression vectors include the human factor IX promoter, the TJ promoter, the TJ promoter. The axpression vectors of the invention may be used in gene therapy to provide age-related and/or liver specific expression of target genes. Age-regulatable constructs may be used in the treatment of such age-related conditions such as thrombosis, cardiovascular disease, diabetes, Alzheimer's disease, Parkinson's disease, cancer, osteoporosis, osteoatrhritis and dementia. Specifically, they may be used to express factor IX antisense mRNA in the treatment of thrombotic conditions associated with the natural age-related rise in factor IX expression. Transgenic cells or animals that contain vectors of the invention are useful as models of these diseases, in screening for potential therapeutic agents and for studying normal processes such as equences, are useful as probes to detect, isolate or identify other such sequences in samples. The present sequence represents the hPC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a single exon nucleic acid probe (SENP) (I) for measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined mucleotide sequences given in the specification (or complements/ fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is
                                                                                                                                                                                                                                                                                                                                Human, single exon nucleic acid probe, liver, cirrhosis, hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia, coronary heart disease, ss.
                                                                                                                                                                                                                                                                                                  Human liver single exon probe, SEQ ID No 20284.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 4; SEQ ID NO 20284; 658pp; English.

Spatially-addressable set of single exon nucleic acid probes, used to

measure dene express

```
The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising shaingle exon nucleic acid probes having one of roughleic acid probes for measuring gene expression in a sample derived from the 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12814 open reading framed derived from the 12614 probes. Also included are a matcroarray comprising the novel set of probes of the human lung; measuring set high stringency to a nucleic acid expressed in the human lung; measuring specific production to a sample acid expressed in the human lung; measuring the label derectably bound to each probe of the array, identifying exons in a eutsavotic genome, comprising (a) and producting at least one exon from genomic sequences of the eutsavote, and (b) detecting specific hybridistation of detectably the above mentioned microarray, assigning exons to a single exon probe, laving a fragment identical to the predicted exon, the probe is included in a the above mentioned microarray, assigning exons to a single exon probe, comprising (a) identifying the expression of each of the exons in several tissues and/or cell types using hybridisation to a single exon microarray when any and probe with the exon, where a common pattern of a probes/open reading frames (ORF). The probes are used for gene expression of the exons in the second to the exons should be assigned to a single gene, a peptide comprising or analysis, and for identifying exons in a gene, particularly using human lung derived many and for the study of lung diseases such as assigned to a single gene, a peptide comprising on the exons in the second of the exons in the second of the exons in a gene, as the accordance of the prince of analysis, and for identifying exons in a gene, particularly using human lung derived many hypertension and hypertension and hypertension pulmonary dysplates, pulmonary dysplates, pulmonary dysplates, pulmonary dysp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1620 CCTGCTTTTGACCTGCCTTCTTCCCCTTCCTATTCCTTTGGTTTTTGCATAGTGTCTC 1679

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5' - and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence was used as the representative sequence from a human clone which was used in homology searches to identify the clone. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO

ABQ47966;

The invention relates to primers for synthesising full length CDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for Synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is the nucleotide sequence of the 5'-end of a CDNA provided in the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from BPO

```
This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-0pG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligomochecides and/or peptide-nucleic acid (DNA) oligomers and the degree of hybridisation to both classes is determined from the label on the run of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used:

(i) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP, s); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously. ABQ13410-ABQ54121 represent genomic DNA sequences used to illustrate the method for disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1499 GTGGGGAGTTTCTTTTCCGGTCCAATCTATTTGGTGTTTTGTATGCTTCTTGTACCTTGA 1558
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                431 GGGGGTCGTTTTTCGTTCGGGGTGATTTCGTTTTTTTGGGCGATGTTTTTTATTTTAGG 490
                                                                                                                                                                                                                                                                                                                                                                                                      Determining the degree of cytosine methylation in genomic DNA, useful fodiagnosis and prognosis, comprises selective hybridization of amplicons from chemically treated DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  491 naccionintriricancecinematecenarienes intrinamentale de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca del marca del marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca de la marca d

```

```
methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligoners and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligoners, the degree of methylation is calculated. The method is used: (i) for diagnosis and/or prognosis of side effects of the central nervous, cardiovascular, gasteointesinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNPs); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously. Apgl3410-ABG$121 represent genomic DNA sequences used to illustrate the method in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1499 GIGGGGAGTITCITITCCGGTCCAAICIATITGGIGTITIGIAIGCTICITGIACCTIGA 1558

This sequence (nfSP8-299) encodes a flea midgut serine protease (PfSP8-99), and has been isolated from a flea cDNA library by PCR using primers AAT40862-63 and hybridisation with probe AAT40866, based on conserved serine protease sequences. The sequence contains sequence AAT4086 (nfSP8-186), which spans 2 conserved serine protease sequence AAT40826 (nfSP8-6), which spans 2 conserved serine protease sequence (N- and C-terminal regions) and internal sequence AAT40826, since the appropriate produce a recombinant vaccine for protection of domestic animals from flea infestation, or in isolation of protease-inhibitors which may be used in controlled release formulations to reduce the flea burden on and around the animal. The inhibitors may be included in insecticidal compositions to increase efficacy of other active compounds, by reducing proteolytic activity in the flea midgut
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  142 CCAGGGTAGGGGCACTACCGCATTCCCTCTCTTCCAAACACTTCTATTTCTTGATTTC 201

Efficient processing and release of mature two-chain factor X into the circulation requires; removal of the signal sequence, formation of circulation requires; removal of the signal sequence, formation of circulation of control certains globes, control control control circulation of N and olinked oligosacchaides to the activation peptide; control circulation of N and olinked oligosacchaides to the activation peptide; cemoval of an internal tripeptide to yield two-chain factor X and removal control appear essential for factor X function the removal control appear essential for factor X function the removal of the signal sequence, propeptide, internal tripeptide and full gammandications are all steps which are important requisites for the production of biologically active factor X/Fxx Isolated chimeric production of biologically active factor X/Fxx Isolated chimeric production of biologically active factor X/Fxx Isolated chimeric production of biologically active factor X/Fxx Isolated chimeric production of an WDP to produce a propebtide fused to a nucleic acid sequence encoding a vitamin K-dependent protein gamma-carboxylation enhancers and are useful for optimissing the gamma-carboxylation constructs result in the production of fully gamma-carboxylated mature WEDPs, which are the production of fully gamma-carboxylated mature WEDPs, which are propeptide sequences (modified or not) and WEDPs. This sequence encodes the signal, propeptide and mature protein sequence of human Factor X
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1528 ITTGGTGTTTTGTATGCTTCTTGTACCTTGATAGGCATCTCTTTCTCAAGGTTAGGAAAT 1587

The invention relates to a gene expression profile comprising one or more genes (ABZ34889-ABZ35692) and generated from a cell type. The cell type is a coronary arery endothelium, umbilical arery vein endothelium, dermal microvascular endothelium, pulmonary artery endothelium, myometrium microvascular endothelium, prostate endothelium, renal epithelium, prostate epithelium, renal epithelium, renal proximal tubule epithelium, cell airway epithelium, renal epithelium, umbilical artery smooth muscle, menatal dermal fibroblast, pulmonary artery smooth muscle, corner smooth muscle, mesangial cells, ocronary artery smooth muscle, actrockes, corner smooth muscle, uterine smooth muscle, lung fibroblast, ocronary artery smooth muscle, or determining the level of RNA expression profile is used for determining the level of RNA expression for a sample, determining the phenotype of a cell and distinguishing cell types. The gene or a protein expression profile is useful in identifying disease pathologies involving provide meaningful information with respect to tumour type and stage, reatment methods, and prognosis. The gene or protein expression profile may provide meaningful information with respect to tumour type and stage, creatment methods, and prognosis. The gene or protein expression profile may also be used for creating microarrays. The microarray is useful for antifications and prognosis. The gene or protein expression profile mayping of organisms, confirming cell or tissue defining all angebras and in identifying promising antibiotics, antivital or antivital or antivital or antivital or antivital or antivital or antivital or antivital or antivital or antivities and in identifying promising antibiotics, antivital or antivital or antivital or antivital or antivital or antivital or antivital or antivital or antivital or antivital or antivital or antivital or antivital or antivital or antivital or antivital or antivital or antivital or antivital or antivity and prognosis antivital or antivital or antivital or antivital o

```
The invention relates to a method of determining whether a patient will respond to treatment with a farnesyl transferase inhibitor (FTI), by analyzing the expression of gene that is differentially modulated in the presence of an FTI. The method is useful for determining whether a patient will respond to treatment with a FTI such as (B)-6-[amino(4-chlorophenyl)](1-methyl-1H-imidazol-5-yl)methyl]-4-(3-chlorophenyl), amethyl-2-(1H)quinollinne, monitoring the therapy of a patient, treating a patient with leukemia with FII if the analysis indicates that the patient will respond. This sequence corresponds to a gene whose expression may be modulated in the presence of FTI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1528 TITGGTGTTTTGTATGCTTCTTGTACCTTGATAGGCATCTCTTTCTCAAGGTTAGGAAAT 1587

(HUMA-) HUMAN GENOME SCI INC

Ruben SM, Komatsoulis GA, Birse CE, Moore PA;

WPI; 2001-343795/36. P-PSDB; AAE03821. Isolated nucleic acid molecule encoding a human secreted protein is used in preventing, treating or ameliorating a medical condition.

Claim 1; Page 440-441; 553pp; English.

AND MAD08283-AAD08355 represent cDNAs corresponding to 23 human secreted

Drotein genes, and ABC03896 represent the proteins they encode.

AEC03871-AAEC03896 represent human secreted protein fragments or variants.

The secreted proteins and their genes are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy.

CC ameliogical conditions can be diagnosed by determining the amount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 23 genes, based on the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative disorders, theorem. Foetal and developmental abnormalities, hematopoietic disorders, diseases of the immune system, AIDS, autoimmune diseases (e.g., rheumatoid arbhritis), inflammation, allargies, neurological disorders (e.g., Alzheimer's disease, Parkinson's disease), cognitive disorders (e.g., Alzheimer's disease, Parkinson's disease), cognitive disorders, diaberes, athema, sathma, skin disorders, and infections. The proliferation, to prevent skin aging due to sunburn, to maintain organs or pregnancy-related disorders, endocrine disorders, and infections. The proliferation, to prevent skin aging due to sunburn, to maintain organs to regenerate tissues, to identify their cognate ligands or binding to partners, and in chemotaxis, and can be used as a food additive or

RESULT 35

```
The invention relates to an isolated polynucleotide comprising any one of 38043 cDNA sequences, appearing as ACH12789-ACH50811, whose sequence was determined by the technique of SBH (sequencing by hybridisation). Also included is a purified polypeptide comprising a sequence corresponding to a reading frame of the novel polynucleotide. The nucleic acid sequences are useful in diagnostics as expressed sequence tags (SST) for includentifying expressed genes or for physical mapping of the human genome, in forenside, in assessing biodiversities, or in identifying mutations in sessential as hybridisation probes, as oligomers for PCR, for circomosome and gene mapping, in the recombinant production of for circomosome and gene mapping, in the recombinant production of cortion of an enerating antisense DNA of it. The present sequence is useful for generating antisense DNA of it. The present sequence is one of the 38043 isolated cDNA/EST sequences. Note: The sequence data obtained in electronic format directly from USPTO at continuous production, but was obtained in electronic format directly from USPTO at sequence. The sequence data obtained in electronic format directly from USPTO at sequence thimilibocides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New polynucleotide sequences obtained from various cDNA libraries, useful as hybridization probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of protein, or in generating

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to human single exon nucleic acid probes (SENP). The present sequence is one such probe. The SENPs are derived from human Hela cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithehial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Probe #9609 for gene expression analysis in human cervical cell sample.

The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but, was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human genome-derived single exon nucleic acid probes useful for analyzing

                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to single exon nucleic acid probes (SENP). The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders
                                                                                                                     Probe #13557 used to measure gene expression in human placenta sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0; Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart. The present sequence is one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form at directly from WIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ő
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1626 TITGACCTGCCTTCTTCCCCTTCCTCTATTCCTTTTGGTTTTTGCATAGTGTCTCTGGCTT 1685
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Single exon nucleic acid probes for analyzing gene expression in human
                                                      Probe #10292 for gene expression analysis in human heart cell sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0; Gaps

Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human bone marrow.
                                                                                                                                                                                                                                                                                   probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; brain expressed exon; gene expression analysis; probe; microarray;

The invention relates to a single exon nucleic acid probe (SENP) (I) for measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined nuclectide sequences given in the specification (or complements/ fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be in sampled erived from human adult liver. The genes identified may be in sampled erived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproteinsemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABS25011-ABS51005 represent human liver single exon nucleic acid probes of the invention. Note: The sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly from WIPO at the wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1626 TITGAÇCIGCCITÇITÇCCCCTTCCTCTTTCCTTTTGGTTTTTGCATAGTGTCTCTGGCTT 1685

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        TITGACCIGCCITCTICCCCTTCCTCTITCCTTTTGCATAGIGICTCTGGCTT 1685
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is one of the probes of the invention

The present invention relates to novel single exon nucleic acid probes. The present sequence is one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, particularly chose diseases with polygenic aciology. The diseases include breast cancer, disorders of development, inflammatory diseases include breast, tibrocystic changes, proliferative breast disease and non-carcinoma tumours. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                     Novel single exon nucleic acid probe used to measuring gene expression in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    277 forcectectractordecorotoantrotrococorotocrotorotord

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes for the 1284 open reading frames derived from the 1214 complements or the 1284 open reading frames derived from the 1214 probes. Also included are a microarray comprising the novel set of probes of the complements or the 1284 open reading frames derived from the 1214 probes. Also included are a microarray comprising the novel set of probes of the numan lung, comprising the acids derived from human lung measuring gene expression in a sample derived from human lung masuring the label detectably bound to each probe of the array identifying exons in a evikaryotic genome, comprising (a) and probe of the array identifying exons in a evikaryotic genome, comprising (a) and probe in the fact of array; identifying exons in a evikaryotic genome, comprising (a) and probe in the predicted exon from genomic sequences of the everyote; and (b) detecting specific hybridiation to each probe of the aving a fregment identical to the predicted exon, the probe is included in the above mentioned microarray; assigning exons to a single exon in the above mentioned microarray assigning exons to a single exon microarray having a probe with the exon, where a common pattern of expression of the exons should be assigned to a single gene, a peptide comprising or probes/open reading frames (ORF). The probes are used for gene expression of the exons in the tissues and/or cell types undicated to a single gene, a peptide comprising or cancer, chronic obstructive pulmonary disease (CDP), interstitial lung cancer, chronic obstructive pulmonary disease (CDP), interstitial lung derived many and for the study disease (CDP), interstitial lung cancer, chronic obstructive pulmonary disease (CDP), interstitial lung present sequence is a cindosis, pulmonary disease, pulmonary disease, pulmonary disease, pulmonary disease, pulmonary disease, pulmonary disease, pu

This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated diemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonachecides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of clip and of a wide range of methylation is calculated. The method is used: (i) for diagnosis and/or prognosis of side effects of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation. The method allows the methylation interest of many C residues to be determined simultaneously. Abgülstlo. ABGS+121 represent genomic DNA sequences used to illustrate the method for the determined determined in the

No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences conversed from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design 111 TOTOTOTOTOCOTTICTOTARCACTICTGGGCCAGGGTAGGGGCACTACCGCATTCCCTC 170 135 icicacacticccaecticcacatcceadactedateadacadedacacadateadaca

New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures.

This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a connect sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated (C, to uracil, then part of the genomic sample of but not methylated (C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (DNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used:

(i) for diagnosis and/or prognosis of side effects of the rangentic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP, s), and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously. ABQ14410- for Astransian and the method allows the methylation of ABASTAL represent genomic DNA sequences used to illustrate the method for Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Astransian and Ast

Nucleic acid selected from one of 106 genes comprising single nucleotide polymorphisms, allele-specific oligonucleotides to the genes are useful for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis.

Claim 1; Fig 5; 214pp; English

The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose used to dispasses of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's diseases. Note: The degenerate codon within the sequence represents the position of an SNP, for example the letter S represents a polymorphism where the nucleotide may be C or G

```
The invention relates to an isolated polynucleotide (I) comprising: (a) any of a group of over 4000 nucleotide sequences (ABV94628-ABV99145); (b) complements of (a); (c) sequences consisting of at least 20 contiguous residues of (a); (d) sequences consisting of at least 20 contiguous residues of (a); (d) sequences having at least 75% or 90% identity to (a); or (f) degenerate variants of (a). Polypeptides (ABP68596 ABP68637) encoded by (I) and oligonucleotide can be used to detect cancer in a patient and compositions comprising polypeptides (ABP68596 antibodies, fusion proteins, T cell populations and antigen presenting cants simulating an immune response. The polymucleotides can be used as probes or primers for nucleic acid hybridisation, in the design and proteins in the tumour cells, in vaccines and for gene therapy. Note: The sequence data for inhibiting expression of the tumour cells of the polymucle format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1802 TCAGTGAGGCTTGTCTCTGAGGTTCCTGTTGGGTTCTTAATTTTTTCATTTCCAGATTTC 1861

This PCR fragment was used as a probe to screen a rat hypothalamus cDNA library. 2 Independent clones, named 27A (see AAV82828) and 16.6, were obtained. Clone 27A codes for a novel full-length rat galanin receptor, designated GALR2 (see AAW61461). The invention provides methods for identifying ligands particular to mouse GALR2 (see AAW61463). Such ligands may be useful therapeutically e.g. to treat obesity or cognitive disorders involving excess galanin or to treat pain or anorexia involving

Sequence 283 BP; 27 A; 116 C; 84 G; 56 T; 0 U; 0 Other;

insufficient galanin

New mouse galanin receptor, GALR2, - useful to identify agonists and antagonists to treat conditions involving galanin, e.g. for treating

obesity, pain or cognitive disorders.

The invention relates to mouse galanin receptor 2 (GALR2) and the nucleic acid encoding the novel polypeptide. The sequences are useful in assays for identifying GALR2 ligands that are useful for treating obesity, pain and cognitive disorders. The sequences are also useful for identifying agonists, antagonists, suppressors or inducers of GALR2. This sequence represents a CDNA probe used to isolate rat GALR2, used in the methods of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid encoding mouse galanin receptor 2, useful in assays fidentifying galanin receptor 2 ligands for treating obesity, pain and cognitive disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This PCR fragment was used as a probe to screen a rat hypothalamus CDNA library. 2 Independent clones, named 27A (see AAV49229) and 16.5, were obtained. Clone 27A codes for a novel full-length rat galanin receptor, designated GALR2 (see AAW61385). The invention provides methods for identifying ligands particular to human GALR2 (see AAW61386). Such ligands may be useful therapeutically e.g. to treat obesity or cognitive disorders involving excess galanin or to treat pain or anorexia involving
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New human galanin receptor, GALR2, - useful to identify agonists and antagonists to treat conditions involving galanin, e.g. for treatment of obesity or cognitive disorders.
                                                                                                                                                              This PCR fragment was used as a probe to screen a rat hypothalamus cDNA library. 2 Independent clones, named 274 (see AAV35648) and 16.6, were obtained. Clone 27A codes for a novel full-length rat galanin receptor, designated GALR2 (see AAW49002). The invention provides methods for identifying ligands particular to GALR2. Such ligands may be useful therapeutically e.g. to treat obesity or cognitive disorders involving excess galanin or to treat pain or anorexia involving insufficient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

2001-408281/43. WPI; 2001-408281/ P-PSDB; AAU12282. Isolated , secretory and transmembrane PRO polypeptide used to detect other PRO polypeptides, link bloactive molecules to cells expressing PRO polypeptides, and detect the presence of mammalian tumors e.g. lung, breast, prostate, cervical.

Claim 3; Fig 221; 813pp; English.

AAS21244-AAS21518 encode for novel human secretory and transmembrane PRC polypeptides. The PRC polypeptides are useful to detect other PRC polypeptides, to link bioactive molecules to cells expressing PRC polypeptides, to modulate biological activities of cells expressing PRC

polypeptides, and to detect the presence of mammalian lung, colon, breat, prostate, rectal, cervical or liver tumours by comparing FRO polypeptide expression in a cell sample to that in a control sample. Some of the 275 sequences are also useful to stimulate the release of tumour necrosis factor-alpha (TMF-alpha) from human blood, the proliferation or differentiation of chondrocytes, the proliferation or gene expression in perioryce cells, the release of proceedycans from cartilage, the proliferation of inner aar unticular supporting cells or of Thompsphides and modulate glucose or free farth acid uprake by skeletal muscle cells or by adipocytes; or inhibit binding of A-peptide to factor VIIA. The PRO polypeptides can be used in assays to identify molecules involved in binding interactions. The polymulochtides encoding PRO polypeptides can be used to generate probes, antienne RNA/DNA, transgenic or knock out animals and can be used in gene therapy ö Gaps 0 Query Match

The invention describes an isolated nucleic acid (I) comprising, or which has 80 % sequence identity to, or the full-length coding sequence of, one of 55 mucleotide sequences, and which encodes a corresponding comparation of polypeptide selected from 275 amino acid sequences, where all sequences of cerect PRO polypeptides, link a bloactive molecule to a cell expressing a ROO polypeptide, modulate a biological activity of a cell, stimulate the release of tumour necrosis factor (TNF)-alpha from human blood, modulate of glucose or free fatty acid by cells, stimulate or inhibit the proliferation or differentiation of cells or gene expression, stimulate the release of proteoglycans, stimulate the release of cytokine to proliferate blood monounclear cells, inhibit the binding of A-peptide to factor VIIA, or detect the presence of tumour in a mammal. The nucleic acid and polypeptide encoded by it, are useful for treating inflammatory birth defects, premature aging, acadiac injury, infertility, birth defects, premature aging, acadiac injury, infertility, birth defects, premature aging, acquired immunodeliciency syndrome (AIDS), cancer, or diabetic complications. The nucleic acid is useful as hybridisation probes, in chromosome and gene mapping, and in generating antisense RNA or DNA. The polypeptides are useful as pharmaceuticals, consistence encodes a novel human secreted and transmembrane PRO
                                                                                                                                                                                                                                                                                 Gao W;

New isolated PRO polypeptide useful for treating diabetes, rheumatoid arthritis, sports injuries, obesity, hearing loss in mammals, stroke, or heart attack.

Claim 2; Fig 221; 643pp; English.

The present invention relates to the isolation of novel human PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides and polynucleotides are useful for preparing a medicament useful in the treatment of diabetes, bone and/or cartilage disorders (e.g. rheumatoid arthritis, sports injuries, osteoarthritis), obesity, hyper-or hypo-insulineamia, hearing loss, and coagulation disorders (e.g. stroke, heart attack). Anti-PRO antibodies are useful in diagnostic assays for PRO, by detecting its expression in specific cells, tissues or serum, and for affinity burification of PRO from recombinant cell culture or natural sources. ACA66994-AAA6768 represent cDNA sequences encoding the human PRO polypeptides of the invention. Note: The sequence data for this patent was obtained in electronic format directly from the USPTO web site at segdata.uspto.gov/psipsDIDEntry.html

```
The present invention relates to the isolation of novel human PRO polypeptides, and the polynucleotide sequences encoding them. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are useful for detecting other PRO polypeptides, for linking biological activities of cells expressing PRO polypeptides, and for for identifying agonists or antagonists. The PRO polypeptides are useful for the stimulating the release of tumour necrosis factor (TNF)-alpha from human blood, for stimulating the proliferation or differentiation of chondrocytes, and detecting the proliferation or differentiation of chondrocytes, and detecting the presence of tumours. The polynucleotide sequences encoding PRO polypeptides are useful as hybridisation probes, in chromosome and gene mapping, in the generation of antisense RNA and DNA, in the preparation of PRO polypeptides, for generating transgenic animals or knockout animals, for the generation of antisense RNA and genetic disorders, and in gene therapy. Gao W;

The invention describes an isolated human PRO polypeptide. The PRO polypeptides are useful in detecting PRO polypeptides in a sample, in linking a bioactive molecule to a cell expressing a PRO polypeptide, and in modulating at least one biological activity of a cell expressing a PRO cuseful for treating cardiac insufficiency disorders. PRO184 and PRO186 polypeptide. PRO1312 stimulates hypertrophy of neonatal heart and is thus cardiac insufficiency disorders. PRO1854 and PRO186 cuseful for treating cardiac insufficiency disorders. PRO1856, PRO88

New isolated nucleic acid encoding a PRO polypeptide, e.g. PRO1114 or PRO4978, useful in molecular biology, chromosome and gene mapping, in generating antisense RNA and DNA, and in gene therapy.

# Claim 2; Fig 221; 659pp; English.

The invention relates to an isolated nucleic acid comprising at least 80% sequence and transmembrane protein) cDNA comprising a nucleic acid (a) encoding a PRO polypeptide, or its extracellular domain (with or without its associated signal peptide), which comprises any of the 275 120-850 residue amino acid sequences, given in the specification; (b) comprising any of the 275 300-3500 nucleotide sequences, given in the specification; or (c) comprising the

```
till-length coding sequence of the nucleotide sequences given in the specification, or of the DNA deposited under any of the American Type Culture Collection (ATCC) Accession Numbers listed in the specification. Also included are a vector comprising the novel nucleic acid, a host cell comprising the vector producing a PRO polypeptide, the isolated PRO polypeptide of timed to a chimeric molecule comprising the PRO polypeptide of timed to a heterologues amino acid sequence, an anti-PRO antibody, detecting a PRO polypeptide in a sample suspected of containing the PRO polypeptide, include a bloactive molecule to a cell expressing a PRO polypeptide, stimulating the release of tumour necrosis factorialpha (TNP-alpha) from human blood, (or proteoglycans from cartilage or cytokine from peripheral blood mononuclear cells (PBMC)), andipocyte cells stimulating the proliferation of differentiation of adipocyte cells stimulating the proliferation of inner ear utricular supporting calls or proliferation of inner ear utricular supporting cells (or of T-lymphocyte cells, or of endothelial cells), inhibiting the binding of A-peptide to factor VIA, or differentiation of adipocyte cells (or proliferation for in mammal and an or oligonucleotide probe derived from any of the nucleotide sequences given in the specification. The polynucleotide is useful in molecular biology, including uses as hybridiserion probes, in chromosome and gene mapping, in generating antisense RNA and DNA, and in gene therapy. The propoment and screening of therapeutically useful reagents. The PRO polypeptide or the polympetide or responsive to the polypeptide or antibody, such as tumours, and in cesponsive to the polypeptide or sequence encodes a PRO polypeptide or vergons and in preparing a medicament for treating a condition or vergons and in preparating either transgenic and in cesponsive to the polypeptide or antibody, such as tumours, and in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 1129 BP; 231 A; 369 C; 335 G; 194 T; 0 U; 0 Other;

ACA04134/c RESULT 61

ACA04134 standard; cDNA; 1129 BP.

ACA04134;

27-MAY-2003 (first entry)

Human cDNA encoding a secreted/transmembrane protein, SEQ ID 221.

Human; ss; gene; secreted protein; transmembrane protein; PRO; inflammatory disease; organ failure; atherosclerosis; cardiac injury; infertlity; birth defects; premature aging; AIDS; biosensor; acquired immunodeficiency syndrome; cancer; diabetic complication; bioreactor; tumour.

Homo sapiens.

New secreted and transmembrane nucleic acids and polypeptides, designated as PRO, useful for treating inflammation, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, or cancer.

# Claim 2; Fig 221; 659pp; English.

The invention relates to an isolated nucleic acid comprising, or which is at least 80% identical to, or the full-length coding sequence of, any of the 25 nucleotide sequences, encoding the corresponding PRO polypeptide (one of 275 secreted or transmembrane proteins). The nucleic acid further comprises the full-length coding sequence of the DNA deposited under American Type Culture Collection (ATCC) accession number in a list given in the specification. Also included are vectors and host calls for producing PRO proteins, Also included are vectors and host calls for extracellular domains and mature sequences, methods of detecting PRO proteins, methods for stimulating the release of TNF-alpha (tumour concerning PRO proteins, methods for stimulating the release of TNF-alpha (tumour carilage, proliferation of fondrocyte cells, the release or proliferation of carrilage, proliferation of inner ear urticular supporting cells, the carilage, proliferation of T-lymphocyte cells, the release or groteferation of T-lymphocyte cells, the release or grotiferation of conductation of conductating the upcause of glucose or free carrilage, proliferation of the method for modulating the upcake of glucose or free proliferation of T-lymphocyte cells, a method for inhibiting the problem of the differentiation of adipocyte cells, a method for detecting the presence of a tumour in a mammal and oligonucleotide probe derived from any of the nucleotide sequences cited above. The nucleic acids and polypeptides are useful for treating of infammatory diseases, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS (acquired immunodeficiency syndrome), cancer, or diabetic complications. The nucleic acids are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. Both concert invention and in generating antisense RNA or DNA. The polypeptides are useful in tissue typing. The present sequence encodes a PRO protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     30-DEC-1999
                                                                                                                                                                                                                                                                                                                                                                                     12-JUN-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                         .3-SEP-1
The invention describes 305 nucleic acids encoding PRO (secreted and transmembrane) polypeptides (I). (I) is useful for stimulating the uptake of release of TMP-alpha from human blood, for modulating the uptake of glucose or FPA by skeletal muscle cells or adipocyte cells, for stimulating the proliferation of or gene expression in pericyte cells, for stimulating the proliferation of or gene expression in pericyte cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating proliferation of endothelial cells, for stimulating the proliferation of endothelial cells, for stimulating the proliferation of endothelial cells, for stimulating proliferation of endothelial cells, for detecting the presence of tumour in a mammal. The tumour is lung, colon, breast, prostate, rectal, cervical or liver tumour. The oligonucleotide probes are useful for isolating genomic and CDNA nucleotide sequences or are useful for isolating genomic and CDNA nucleotide sequences or interaction. A polymuleotide (II) encoding (I) is useful in chromosome mapping, in generation of antisense RNA and DNA, in the preparation of PRO polympeptide, for generating transgenic animals or knockout animals which in turn are useful in the development and corremoning of therapeutically useful reagents, in gene therapy, for chromosome identification, as chromosome marker, and for generating probes. An anti-(I)-antibody is useful in the development and probes. An anti-(I)-antibody is useful in the development and correcting its expression in specific cells, tissues or serum, and for secures (I) and (II) are useful for tissue typing. This sequence encodes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; gene; ss; PRO; secreted polypeptide; transmembrane polypeptide; tumour necrosis factor-alpha; TWF-alpha; chondrocyte cell; tumour; cancer; adrenal; lung; colon; breast; prostate; rectum; kidney; cervix; live; microvascular endothelial cell; glucose; FRA; skeletal muscle cell; adipocyte cell; glucose; FRA; endothelial cell tube formation; bone disorder cell; endothelial cell tube formation; bone disorder; cartilage disorder; sports injury; proteogylvan; articular cartilage defect; osteoarthritis; rheumatoid arthritis; haemoglobin-associated disorder thalassaemia; immune system cell infiltration.

#### WPI; 2003-687639/65. P-PSDB; ADA76172.

New isolated nucleic acid encoding a secreted and transmembrane polypeptide, designated e.g. PRO1114 or PRO4978, useful in chromosome and gene mapping, in generating antisense RNA and DNA, and in gene therapy.

## Claim 2; Fig 221; 659pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for simulating the release of tumour necrosis factor-albba (TNR-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for proliferation or differentiation of chondrocyte cells and a method for opporting the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The prolymucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisenses kNA and DNA and in gene therapy. The polymucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of herapeutically useful.

Competing either transgenic animals or knock-out animals which are useful in the development as tumours, for stimulating of proparing a condition responsive to the polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of submer ear utricular supporting cells, for stimulating differentiation of adipocyte cells, for stimulating differation of inner ear utricular supporting cells, for stimulating are useful for treating such a sports injuries and articular cartilage are useful for treating such as sports injuries and articular cartilage are useful for treating sports earlied of signification of supporting thalassemias and carticular parances and articular cartilage are useful for treating various mammalian and articular submaned local immune system cell infiltration. This associated disorders such as various thalassesement and manned for transpressed from uspresented f

```
The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the presence of a tumour in a mammal (e.g. lung, colon, breast, prostate, rectal, cervical and liver tumours). The polynucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polynucleotides are useful in molecular by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the colon polypeptides or antibodies are used in preparing PRO polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or antibodies, such as tumours, for modulating the uptake of glucose or FRA by adipocyte cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the release of proteoglycans from pericyte cells, for stimulating the release of cytokines from PBMC cells, for inhibiting the binding of A-peptide to factor VIIA, for inhibiting the binding of A-peptide to factor VIIA, for inhibiting the binding of A-peptide to factor VIIA, for proliferation of endercedies of the invention. One of this sequence capresents a human PRO polymucleotide of the invention. One the sequence capresents a human page of all and and an antibodies.
New PRO nucleic acid, useful for preparing a composition for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

New PRO nucleic acid and encode polypeptides, are useful for manufacturing a medicament for diagnosing or treating cancer

### Claim 2; Fig 221; 660pp; English.

The invention describes 305 mucleic acids encoding PRO (secreted and transmembrane) polypeptides (I). (I) is useful for stimulating the profile from human blood, for modulating the uptake of glucose or FRA by skeletal muscle cells or adipocyte cells, for stimulating the proliferation or differentiation of chondrocyte cells, for stimulating the proliferation of or gene expression in pericyte cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of Tlymphocyte cells, for stimulating the proliferation of Tlymphocyte cells, for stimulating the proliferation of Tlymphocyte cells, for stimulating the proliferation of Tlymphocyte cells, for stimulating the proliferation of Tlymphocyte cells, for stimulating proliferation of Tlymphocyte cells, for stimulating the brinding of A-peptide to factor VIIA, for inhibiting the differentiation of adipocyte cells, for stimulating proliferation of endothelal cells, for stimulating proliferation of endothelal cells, for stimulating proliferation of endothelal cells, for stimulating proliferation of endothelal cells, for stimulating proliferation of endothelal cells, for stimulating proliferation of endothelal cells, for stimulating proliferation of endothelal cells, in dispension of proparation of reviews and consequences or are useful for isolating genomic and coher and endother protein of antisense probes (I) is also useful and endother endother and corremptor of the proparation of antisense RNA and DNA, in the proparation of PRO polypeptide, for generating transgent and correming of therapeutically useful reagents, and for generating probably in generation of antisense probases or serum, and detecting its expression in specific cells, tissues or serum, and for affinity purification of PRO from Economic cells, tissue typing. This sequence encodes confined the superior cells, tissue typing. This sequence encodes

Gao W;

Novel secreted and transmembrane PRO polypeptides useful for stimulating the release of tumor necrosis factor alpha and detecting the presence of tumor in a mammal.

stimulating the

Claim 2; Fig 221; 660pp; English.

The invention describes 305 nucleic acids encoding PRO (secreted and transmembranes) polypeptides (1). (1) is useful for stimulating the release of TNF-alpha from human blood, for modulating the uptake of glucose or FRA by skeletal muscle cells or adipocyt

WPI; 2003-765415/72. P-PSDB; ADB27771. New PRO nucleic acid, useful for preparing a composition for treating e.g., tumor or for tissue typing

Claim 2; Fig 221; 637pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis

cc factor-alpha (TNF-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. addrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polynucleotides are useful in molecular biology, including uses as a missense RNA and DNA and in gene therapy. The polynucleotides may also consistent in preparing PRO polyopetides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful useful in the development and screening of therapeutically useful useful in the development and screening of therapeutically useful useful in the development and screening of therapeutically useful useful as tumours, for stimulating an inhibiting proliferation of medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of subman miscrovascular endothelial cells, for modulating proliferation of subman of or gene expression in periorte cells, for stimulating the proliferation of inner ear urricular supporting cells, for stimulating the proliferation of inner ear urricular supporting cells, for inducing endothelial cell tube formation and for cartilage defects, osteoarthritis and rheumacoid arthritis. PRO polypeptides which stimulate the release of protogolycans truncitular cartilage are useful for treating various mammalian haemoglobin-may benefit from enhanced local immune system cell infiltration. This sequence encodes a human PRO polypeptide of the invention. Note: The sequence encodes a human PRO polypeptide of the invention. Note: The sequence date for this pasent is also available in electronic format from

ADA86249 standard; cDNA; 1129 BP.

(first entry) 20-NOV-2003

Novel human secreted and transmembrane protein PRO4327 cDNA.

Human; secreted and transmembrane protein; PRO; gene; ss;

Tumour necrosis factor alpha release; TNR-alpha release;

Jucose uptake modulator;

cell proliferation stimulator; cell differentiation stimulator;

cell differentiation inhibitor; cytokine release stimulator; tumour;

liver tumour; breast tumour; prosette tumour; rectal tumour;

cervical tumour; liver tumour; chromosome mapping; gene mapping;

gene therapy; chromosome identification; chromosome marker. 

Homo sapiens.

```
The invention describes 305 nucleic acids encoding PRO (secreted and transmembrane) polypeptides (1). (1) is useful for stimulating the upcake of release of TYD-alpha from human blood, for modulating the upcake of gone expression in peake of stimulating the proliferation or differentiation of chondrocyte cells, for stimulating the proliferation of or gene expression in pericyte cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of endotherial cells, for stimulating the proliferation of endotherial cells, for stimulating the proliferation of endotherial cells, for stimulating the proliferation of endotherial cells, for detecting the presence of tumour in a mammal. The tumour is lung, colon, breast, prostate, rectal, cervical or liver tumour. The oligonucleotide probes are useful for isolating genomic and cells esequences or antisense probes. (1) is also useful as therapeutic agent. PRO is useful in assays to identify other proteins or molecules involved in binding in assays to identify other proteins or molecules involved in binding and gene mapping, in generation of antisense RNA and RNA, in the preparation of PRO polypeptide, for generating transgenic animals or knockout animals which in turn are useful in the development and screening of therapeutically useful reagents, in gene therapy, for chromosome identification, as chromosome marker, and for generating probes. An anti-(1)-antibody is useful in diagnostic assays for RNO, engo probes. An anti-(1)-antibody is useful in diagnostic assays for RNO, as an over a sources on in specific cells, tissue sor serum, and for a source an overed whimen servers of the proper properties of the properties and recombinant cell culture or natural and recome and the properties of the properties and recombined to the properties and recombined to the properties and re
                                                                                                                                                                                                                                                                                        Gao W;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New PRO nucleic acid, useful for preparing a composition for treating
                                                                                                                                                                                                                                                                       Deforge L, Desnoyers L, Filvaroff E, G. 2003-786941/74. P-PSDB; ADB15814 New PRO nucleic acid, useful for preparing a recombinant PRO polypeptide, and for manufacturing a medicament for diagnosing or treating tumor.

Claim 2; Fig 221; 637pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polypucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the prelease of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polymicalecides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polymical cities may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful section as tumours, for stimulating and inhibiting proliferation antibodies, such as tumours, for stimulating and inhibiting proliferation of reagents. The PRO polypeptides or antibodies are used in presparing a medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation glucose or FFA by skeletal muscle cells or adipocyte cells, for stimulating the moliferation of for gene expression in perioyte cells, for stimulating the proliferation of progression in perioyte cells, for stimulating the proliferation of adipocyte cells, for stimulating the proliferation of or gene expression in perioyte cells, for stimulating the proliferation of an appropriate and an analyses. the proliferation of inner car utricular supporting cells or T-lymphocyte cells, for inducing endothelial cell tube formation and for treating various bone and/or cartilage disorders such as sports injuries and arthritis. PRO polypeptides which stimulate the release of proteoglycans from cartilage are useful for treating sports-related joint problems, articular cartilage defects, osteoarthritis and rheumatofid arthritis. PRO polypeptides are also useful for treating various mammalian hemoglobin-associated disorders such as various thalassaemias and conditions which may benefit from enhanced local immune system cell infiltration. This sequence represents a human PRO polymucleotide of the invention. Note: The sequence data for this parent is also available in electronic format from USPIO at segdata.uspto.gov/sequence.html.

modulating the uptake of glucose or free fatty acid by skeletal muscle cells or adipocyte cells.

US2003068795-A1

```
The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TMF-alpha) from human blood, a method for stimulating the prospected, a method for stimulating the release of tumour necrosis factor-alpha (TMF-alpha) from human blood, a method for stimulating the prospected of a tumour in a mammal (e.g. adrema). In the prospection of a tumour in a mammal (e.g. adrema) in the constant prospection of a tumour in a mammal (e.g. adrema). The colymucleotides are useful in molecular biology, including uses as a second in proparing PRO MA and in gene therapy. The polymucleotides may also be used in proparing PRO Polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapoutically useful reagents. The PRO Polypeptides by recombinant techniques and in medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating of human microvascular endothelial cells, for modulating the uptake of stimulating differentiation of adipocyte cells, for stimulating proliferation of inner are articular supporting cells or T-lymphocyte cells, for inducing endothelial cells or adipocyte cells, for stimulating differentiation of adipocyte cells, for stimulating are useful for treating sports injuries and release of proteoglycans from cartilage are useful for treating sports injuries and arthritis and rheumatoid arthritis and rheumatoid arthritis and rheumatoid activities and second may benefit from enhanced local immune system cells and rheumatoid submand of second immune system cells in electronic format may benefit be may benefit be a training spatent is also various beneful sor treating second for the prolemation of the prolemance of the prolemance of the prole
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        from USPTO at segdata.uspto.gov/sequence.html.
                                                                                     Claim 2; Fig 221; 659pp; English.

Novel isolated PRO secreted and transmembrane polypeptides useful for stimulating the release of tumor necrosis factor-alpha from human blood and detecting the presence of a tumor in a mammal.

# Claim 2; Fig 221; 660pp; English

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide a method for stimulating the release of tumour necrosis according the presence of a tumour in a mammal (e.g. adrenal, necrosis of actor-alpha (TNF-alpha) from human blood, a method for stimulating the presence of a tumour in a mammal (e.g. adrenal, lung, certification or differentiation of condrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating of these transgenic animals or knock-out animals which are hybridisation propering PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are used in preparing a condition responsive to the polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours. for stimulating of therapeutically useful readents and screening of incore or PRA by skeletal muscle cells, for modulating the uptake of stimulating differentiation of adipocyte cells, for stimulating proliferation of or gene expression in periotyte cells, for stimulating proliferation of or gene expression in periotyte cells, for stimulating proliferation of an expression in periotyte cells, for stimulating the public stimulating differentiation of adipocyte cells, for stimulating cells or stimulating and and for traating various bone and/or cartilage disconcers such as sports injuries and arthritis. PRO polypeptides which stimulate the release of proteoglycans

```
from cartilage are useful for treating sports-related joint problems, articular cartilage defects, osteoarthritis and rheumatoid arthritis. PRO polypeptides are also useful for treating various mammalian hasmoglobin-associated disorders such as various thalassaemias and conditions which may benefit from enhanced local immune system cell infiltration. This sequence represents a human PRO polymucleotide of the invention. Note: The sequence data for this patent is also available in electronic format
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; gene; ss; PRO; secreted polypeptide; transmembrane polypeptide; tumour necrosis factor-alpha; TNF-alpha; chondrocyte cell; tumour; cancer; adrend; lung; colon; breast; prostate; rectum; kidney; cervix; liver; microvascular endothelial cell; glucose; FRA; skeleral muscle cell; adipocyte cell; pericyte cell; inner ear utricular supporting cell; pericyte cell; endothelial cell tube formation; bone disorder; cartilage disorder; sports injury; proteoglycan; articular cartilage disorder; rheumatoid arthritis; haemoglobin-associated disorder thalassaemia; immune system cell infiltration.

```
The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for proliferation presence of a tumour in a mammal (e.g. adremal, lung, colon, breast, prosetate, rectal, kidney, cervical and liver tumours). The polymucleotides are useful in molecular biology in generating to polymorleotides are useful in molecular biology, in generating a turissense RNA and BNA and in gene therapy. The polymucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of theoryptides may also generating either transgenic animals or knock-out animals which are useful in the development and screening of the properties or antibodies are used in preparing a condition responsive to the polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or antibodies are used in preparing of interaction of adipocyte cells, for stimulating differentiation of adipocyte cells, for stimulating the uptake of stimulating differentiation of adipocyte cells, for stimulating the proliferation of or gene expression in periory cells, for stimulating the proliferation of or gene expression in periory cells, for stimulating and cells. For stimulating the proliferation of or gene expression in periory cells, for stimulating and arthritis. PRO polypeptides which stimulate such as various medicans or training each useful for treating various medicated disorders such as various thalassasemias and carting are useful for treating v
                                                                                                                                                                                                                                                                                         New isolated PRO polypeptides e.g. PRO1801 and PRO1114, useful in the preparation of a medicament for treating a condition responsive to PRO polypeptide, and as therapeutic agents e.g. vaccines.
                                                                                                                        Gao W;

WPI; 2003-786907/74. P-PSDB; ADA85698. New PRO nucleic acid, useful for preparing a composition for treating e.g., tumor or for tissue typing.

Claim 2; Fig 221; 637pp; English.

The invention describes 305 nucleic acids encoding PRO (secreted and transmembrane) polypeptides (I). (I) is useful for stimulating the upcake of glucose or FFA by skeletal muscle cells or adipocyte cells, for stimulating the proliferation or differentiation of chondrocyte cells, for stimulating the proliferation of or gene expression in pericyte cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of endothelial cost stimulating the proliferation of endothelial cost estimulating proliferation of endothelial colls, for stimulating the proliferation of endothelial colls, for stimulating the binding the presence of tumour in a mammal. The tumour is lung, colon, breast, prostate, rectal, cervical or liver tumour. The oligonucleotide probes are useful for seleting groupliferation of endothelial cells, for defecting the proteins or molecules involved in binding in assays to identify other proteins or molecules involved in binding interaction. A polymulectide (II) endothed (II) succells involved in binding in generation of PRO polypeptide, for generating transgenic animals or knockout animals which in turn are useful in the development, and screening of therapeutically useful reagents, in gene therapy, for chromosome identification, as chromosome marker, and for generating the structing for probes. An anti-(I) -antibody is useful in disponent assays for PRO, e.g. Chromosome identification, as chromosome marker, and for generating and for a propertion of the propertion of screening of the propertion of screening of the propertion of screening of second or screening of the propertion of screening of second or screening of second or screening of second or screening of second or screening of second or screening of second or screening of s detecting its expression in specific cells, tissues or serum, and for adfinity purification of RNO from recombinant cell culture or natural sources. (I) and (II) are useful for tissue typing. This sequence encodes a novel human secreted and transmembrane PRO polypeptide.

New PRO nucleic acid, useful for preparing a composition for treating e.g., tumor or for tissue typing.

Claim 2; Fig 221; 637pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNP-alpha) from human blood, a method for stimulating the proliferation of indended of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polynucleotides are useful in molecular biology, including uses as phytidisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polynucleotides may also antisense RNA and DNA and in gene therapy. The polynucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in penerating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful andicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of human microvascular endothelial cells, for modulating definer expression in periorte cells, for stimulating proliferation of of inner ear utricular supporting cells, for stimulating proliferation of of inner ear utricular supporting cells, for stimulating cells, for induding endothelial cell tube formation and for treating various bone and/or cartilage disorders such as sports injuries and ADA96909/

arthritis. PRO polypeptides which stimulate the release of proteoglycans from cartilage are useful for treating sports-related joint problems, articular cartilage defects, osteoarthritis and rheumatoid arthritis. PRO polypeptides are also useful for treating various mammalian hemoglobin-associated disorders such as various thalassaemias and conditions which may benefit from enhanced local immune system cell infiltration. This sequence represents a human PRO polynucleotide of the invention. Note: The sequence data for this patent is also available in electronic format from USPIO at seqdata.uspto.gov/sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; gene; ss; PRO; secreted polypeptide; transmembrane polypeptide; tumour necrosis factor-alpha; TNF-alpha; chondrocyte cell; tumour; cancer; adrenal; lung; colon; breast; prostate; rectum; kidney; cervix; liver; microvascular endothelial cell; glucose; FRA; skeletal muscle cell; adipocyte cell; geriotre cell; inner ear utricular supporting cell; T-lymphocyte cell; endothelial cell tube formation; bone disorder; cartilage disorder; sports injury; proteoglycan; articular cartilage defect; osteoarthritis; rhewmatoid arthritis; haemoglobin-associated disorder thalassaemia; immune system cell infiltration.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNR-alpha) from human blood, a method for stimulating the presence of a tumour in a mammal (e.g. adrenal, lung, or proliferation or differentiation of chondrocyte cells and a method for proliferation presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prosetate, rectal, kidney, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating a natisanse RNA and BNA and in gene therapy. The polymucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening or knock-out animals which are useful in the development and screening or knock-out animals which are useful in the development as tumours, for antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or studential cells, for modulating the uptake of glucose or FRA by skeletal muscle cells, for stimulating differentiation of adipocyte cells, for stimulating the proliferation of inner ar utricular supporting cells, for stimulating the proliferation of inner ar utricular supporting cells, for reating various mentaling and cells. For inducing endothelial cells is entitled to retain a supporting cells, for meating sortes related joint problems, articular cartilage are useful for treating sortes related joint problems, articular as valouse thal sessence and articular submaned local immune system cell infiltration. This may benefit from enhanced local immune system cell infil
                                                                                                                                                                                                     New secreted and transmembrane PRO polypeptides and nucleic acids, useful in detection and treatment of cancer and in modulating the uptake of glucose or free fatty acid by skeletal muscle cells or adipocyte cells.
                                                                                               Gao W;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The invention describes 305 nucleic acids encoding PRO (secreted and transmembrane) polypeptides (I). (I) is useful for stimulating the release of FNF-alpha from human blood, for modulating the uptake of glucose or FFA by skeletal muscle cells or adjoovte cells, for stimulating the proliferation of differentiation of chondrocyte cells, for stimulating the proliferation of or gene expression in periove cells, for stimulating the release of proteoglycans from cartilage, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of T-lymphocyte cells, for stimulating the proliferation of T-lymphocyte cells, for stimulating can be provided to factor VIIA, for inhibiting the differentiation of adjoocyte cells, for stimulating proliferation of endothelial cells, for detecting the presence of tumour in a mammal. The tumour is lung, colon, breast, prostate, rectal, cervical or liver tumour. The oligonucleotide probes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Beresini M, Deforge L, Desnoyers L, Filvaroff E, G

are useful for isolating genomic and cDNA nucleotide sequences or antisense probes. (I) is also useful as therapeutic agent. PRO is useful in assays to identify other proteins or molecules involved in binding interaction. A polymucleotide (II) encoding (I) is useful in chromosome and gene mapping, in generation of antisense RNA and DNA, in the preparation of ERO polypeptide, for generating transgenic animals or knockout animals which in turn are useful in the development and screening of therapeutically useful in the development and chromosome identification, as chromosome marker, and for generating probes. An anti-(I)-antibody is useful in diagnostic assays for PRO, e.g. detecting at its agression in specific cells, tissues or serum, and for affinity purification of PRO from recombinant cell culture or natural sources. (I) and (II) are useful for tissue typing. This sequence encodes a novel human secreted and transmembrane PRO polypeptide.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNR-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polynucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating attribution probes, in chromosome and gene mapping, in generating attribution probes, in chromosome and gene mapping, in generating attribution that the number of the stay. The polynucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in Companion of the stay glucose or FFA by Sketered imustre cells, for stimulating proliferation of or gene expression in pericyte cells, for stimulating proliferation of or gene expression in pericyte cells, for stimulating proliferation of inner ear utricular supporting cells, for stimulating cells, for inducing endothelial cell tube formation and for treating various bone and/or cartilage are cell tube formation and for treating various bone and/or cartilage which stimulate the release of proteoglycans arthcular cartilage are useful for treating sports-related joint problems, articular cartilage defects, osteoarthritis and rheumatoid arthritis. Proplypeptides are also useful for treating various mammalian haemoglobinmay benefit from enhanced local immune system cell infiltration. Note: The sequence represents a human PRO polymclectide of the invention. Note:

Claim 2; Fig 221; 637pp; English

The invention describes 305 nucleic acids encoding PRO (secreted and transmembrane) polypeptides (1). (1) is useful for stimulating the creates of TNN-alpha from human blood, for modulating the uptake of glucose or FRA by skeletal muscle cells or adipocyte cells, for grimulating the proliferation of or gene expression in pericyte cells, for stimulating the proliferation of or gene expression in pericyte cells, for stimulating the proliferation of the capression in pericyte cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of T-lymphocyte cells, for stimulating the proliferation of T-lymphocyte cells, for stimulating the proliferation of T-lymphocyte cells, for stimulating the proliferation of T-lymphocyte cells, for stimulating cells, corrected the presence of tumour in a mammal. The tumour is lung, colon, breast, cells, for stimulating proliferation of endochelial cells, for detecting the presence of tumour in a mammal. The tumour is lung, colon, breast, corrected isolating genomic and cDNA nucleotide sequences or antisense probes. (1) is also useful as therapeutic agent. PRO is useful in assays to identify other proteins or molecules involved in binding in gene mapping, in generation of antisense study in the companies of therapeutically useful reagents, in gene therapy, for chromosome identification, as chromosome marker, and for generating correcting its expression in specific cells, tissues or serum, and for animals or animal servet of probes. (1) are useful in this sequence encodes sourced and transmentation. novel human secreted and transmembrane PRO polypeptide.

New PRO nucleic acid, useful for manufacturing a medicament for

diagnosing or treating tumor.

Claim 2; Fig 221; 637pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the prositeration or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The projuncleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating colon, breast, prostated and mementar biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating a chical manuals or knock-out animals which are setul in the development and screening of knock-out animals which are useful in the development and screening or knock-out animals which are useful in the development and screening or antibodies are used in preparing a condition responsive to the polypeptides or antibodies are used in preparing a muticovascular andothelal cells, for modilating the uptake of thuman microvascular andothelal cells, for modilating the uptake of stimulating differation of inner ar utricular supporting cells, for stimulating the proliferation of inner ar utricular supporting cells, for stimulating cells, for modilating the uptake of stimulating differation of inner ar utricular supporting cells, for stimulating cells, for modilating cells, for modilating cells, for modilating and continues and carthritis. PRO polypeptides which stimulates as ports injuries and articular cartilage are useful for treating sports-related joint problems, also useful for treating sports-related joint problems, associated disorders such as various thalassaemias and andore cartilage defects, osteoarthritis and rhemmatoid at heared local immune system cell infilteration. Gao

for the New isolated, secreted and transmembrane PRO nucleic acid, useful for tdiagnosis, prevention and/or treatment of tumors, such as lung, colon, breast, prostate, rectal, cervical and/or liver tumors.

Claim 2; Fig 221; 637pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNP-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The

```
polynucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating anticense RNA and DNA and in gene therapy. The polynucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and soreening of therapeutically useful cagents. The PRO polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of adipocyte cells, for stimulating proliferation of adipocyte cells, for stimulating proliferation of adipocyte cells, for stimulating proliferation of inner ear utricular supporting cells or T-lymphocyte proliferation of inner ear utricular supporting cells or T-lymphocyte cells, for inducing endothedial cell tube formation and for treating various bone and/or cartilage disorders such as sports injuries and articular cartilage are useful for treating sports-related joint problems, for mon cartilage are also useful for treating various mammalian haemoglobinent associated disorders such as various thalassaemias and conditions which may benefit from enhanced local immune system cell infiltration. This sequence represents a human RRO polymcleotide of the invention. Note:

The sequence represents a human RRO polymcleotide of the invention format from repon at account an appendix also are also useful for the also are also the immune and conditions which may benefit from enhanced local immune system cell infiltration. This sequence represents a human RRO polymcleotide of the invention. Note:

The invention describes 305 nucleic acids encoding PRO (secreted and transmembrane) polypeptides (1). (1) is useful for stimulating the uptake of release of TNF-alpha from human blood, for modulating the uptake of glucose or FPA by skeletal muscle cells or adipocyte cells, for stimulating the proliferation of or gene expression in pericyte cells, for stimulating the proliferation of inner ear utricular supporting cells, cor stimulating the proliferation of inner ear utricular supporting cells, tor stimulating the proliferation of Inner ear utricular supporting cells, for stimulating the proliferation of T-lymphocyte cells, for stimulating the brobiteration of T-lymphocyte cells, for stimulating the proliferation of F-lymphocyte cells, for stimulating the brobiteration of F-lymphocyte cells, for stimulating proliferation of E-long the beptide to factor VIIA, for inhibiting the differentiation of adipocyte cells, for stimulating proliferation of endothelial cells, for stimulating proliferation of endothelial cells, for detecting choracted and colon, breast, prostate, rectal, cervical or liver tumour. The oligonucleotide probes or are useful for isolating genomic and cDNA nucleotide sequences or antisense probes. (1) is also useful as therapeutic agent. PRO in useful in assays to identify other proteins or molecules involved in binding in separation of PRO polypeptide, for generating transgenic animals or knockout animals which in turn are useful in the development and correction, as chromosome identification, as chromosome marker, and for generating correction of probes. An anti-(1) antibody is useful in diagence or screening of therapeutically useful in diagense in a derivative process. An anti-(1) antibody is useful in diagense in anti-(1) and process or an anti-(1) antibody is useful in diagense in a dentification, as chromosome agence or and gene therapy, for the probes, An anti-(1) antibody is useful in diagense or an anti-order and anti-order and acceptance or an acceptance or an acceptance or an acceptance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence encodes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       01-DEC-1999
01-DEC-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          29-NOV-1999
                                                                                        ACD98534;
    RESULT 84
                            ACD98534/
                                                                      The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNR-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and amethod for detecting the presence of a tumour in a mammal (e.g. adremal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The prolynucleotides are useful in melecular biology, in generating a riseases KNA and bin gene therapy. The polynucleotides may also a riseases KNA and bin gene therapy. The polynucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening or knock-out animals which are useful in the development and screening or knock-out animals which are useful in the development as tumours, for stimulating and inhibiting proliferation of antibodies, such as tumours, for stimulating and inhibiting proliferation of human microvascular endothelial cells, for medilating the uptake of stimulating differantiation of antipocyte cells, for stimulating the proliferation of inner ear utrivilar such as sports injuries and arthritis. PRO polypeptides which stimulate cells, for stimulating and continue ear utrivilar such as sports injuries and arthritis. PRO polypeptides which stimulates and the machine are useful for treating various marmalian are cartilage are useful for treating various marmalian and arthritis. PRO polypeptides which stimulassaemias and arthritis and cartilage are useful for treating various marmalian and eaguence tase useful for treating various and may benefit from enhanced local immune system cell infilleration. This sequence tare or this patent is also event in the may benefit from temperation and when the may benefit from te
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New PRO nucleic acid, useful for preparing a recombinant PRO polypeptide, preparing a composition for treating e.g., tumor, or for tissue typing.
                                                                                                                                                                                                                                                                                                                                                     Gao W;

The invention describes an isolated nucleic acid encoding a PRO (secreted and transmembrane) polypeptide. Nucleic acids which encode PRO can be used to generate either transgenic animals or Knock-out animals useful in developing and screening of therapeutically useful reagents. The nucleic acids may also be used in gene therapy, in chromosome identification, as chromosome markers, or in generating probes. The PRO polypeptides are useful as molecular markers protein electrophoresis, and the isolated PRO polypeptides and nucleic acids may be used for recombinantly expressing those markers. The PRO polypeptides and nucleic acids may also be used in tissue typing. Anti-PRO antibodies are useful in diagnostic assays for PRO, and in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New transmembrane polypeptides and nucleic acids encoding the polypeptides, useful in gene therapy, in chromosome identification, as chromosome markers, or in generating probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Baker KP, Beresini M, Deforge L, Desnoyers L, Filvaroff E, G.

WPI; 2003-625490/59.

P-PSDB; ADA74348. 

Novel secreted and transmembrane PRO polypeptides and polynucleotides enceding them, useful for treating bone disorders, arthritis, heart attack, injuries, tumors, and stimulating release of Tumor Necrosis Pactor-alpha from human blood.

Claim 2; Fig 221; 659pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO invention also relates to an antibody which specifically binds to a PRO invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the proferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adremal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The prolynucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polynucleotides may also a release that and some mapping, in generating colon probe by the polymore of the proparating properties by recombinant techniques and in gene therapy. The polymore of the ast the development and screening of knock-out animals which are useful in the development and screening of the proparating as tumours, for stimulating of interaction as tumours, for stimulating and inhibiting proliferation of inner and condition and inhibiting proliferation of inner ear utricular supporting cells or T-lymphocyte cells, for stimulating differentiation of adipocyte cells, for stimulating of the proliferation of inner ear utricular supporting cells or T-lymphocyte cells, for inducing endothelial cells, for madinating the uproblems, brone and/or cartilage disorders such as sports injuries and articular cartilage are useful for treating sports engage of the proliferation of inner ear utricular sports of the proliferation of inner ear utricular sports injuries and articular cartilage are useful for treating sports-related joint problems, articular cartilage are useful for treating sports-related joint problems, associated disorders such as various thalassaemas and conditions. 2003-755068/71. P-PSDB; ADB24581 New isolated, secreted and transmembrane PRO polypeptides and nucleic acids, useful for the diagnosis, prevention and/or treatment of tumors, such as lung, colon, breast, prostate, rectal, cervical and/or liver

Claim 2; Fig 221; 637pp; English.

%XCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCX

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynuclectides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, color, breast, prostate, rectal, kidney, cervical and liver tumours). The colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polymuclectides are useful in molecular biology, including uses as a nicker transpends by recombinant techniques and also the used in preparing PRO polypeptides by recombinant techniques my also consistent in the development and screening of therapeutically useful especial to the PRO polypeptides or antibodies are useful in the development and screening of therapeutically useful resignating the transpends of the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of the proliferation of situal englocyte cells, for stimulating the uptake of glucose or FRA by skeletal muscle cells, for modulating the uptake of stimulating differentiation of almost ecells, for stimulating cells, for stimulating or relymphocyte cells, for inducing endothelial cell tube formation and for treating constitutions and onditions which stimulate the release of prolegolycans arthritis. PRO polypeptides which stimulate the release of proteoglycan arthritis. PRO polypeptides which stimulate the release of proteoglycan artialage are useful for treating sports-related joint problems, arthritis. PRO polypeptides which stimulate the release of proteoglycans artialage are also useful for treating various mammalian haemoglobin-consequence and and/or cartilage are hand as various thalassaemias and conditions which may benefit from enhanced local immune system cells infile for media from USPTO at segdata.uspto.gov/sequence.html

WPI; 2003-755110/71. P-PSDB; ADA82105. PRO nucleic acid, useful for preparing a composition for treating e.g., tumor or for tissue typing.

Claim 2; Fig 221; 637pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynuclectides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polynucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polynucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the approximant and annother animals which are

reagents. The PRO polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of human microvascular endothelial cells, for modulating the uptake of glucose or FPA by skeletal muscle cells or adipocyte cells, for stimulating to stimulating the uptake of stimulating of or stimulating in periotyte cells, for stimulating to proliferation of or gene expression in periotyte cells, for stimulating to proliferation of inner ear utricular supporting cells or T-lymphocyte cells, for inducing endothelial cell tube formation and for treating cells, for inducing endothelial cell tube formation and for treating a sports injuries and arthritis. PRO polypeptides which stimulate the release of proceoglycans from cartilage are useful for treating sports-related joint problems, continuar cartilage defects, osteoarthritis and rheumatoid arthritis. PRO polypeptides are also useful for treating various mammalian haemoglobin-associated disorders such as various thalassaemias and conditions which asystem cartering represents a human PRO polymucleotide of the invention. This sequence cata for this patent is also available in electronic format from USPTO at segdata.uspto.gov/sequence.html.

P-PSDB; ADA85146.

New nucleic acid encoding a PRO polypeptide, useful for preparing a composition for treating e.g. tumor by gene therapy, or for tissue typing.

Claim 2; Fig 221; 637pp; English.

Transmembrane) polypeptides (1). (1) is useful for stimulating the release of TNR-alpha from human blood, for modulating the uptake of release of TNR-alpha from human blood, for modulating the uptake of stimulating the proliferation of differentiation of chondrocyte cells, for stimulating the proliferation of or gene expression in pericyte for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of Inner ear utricular supporting cells, for stimulating the proliferation of Inner ear utricular supporting cells, to stimulating the proliferation of Fordynche (2) or stimulating proliferation of Endowhelm (2) for stimulating of he release of a cytokine from PRMC cells, for stimulating of A-peptide to factor VIIA, for inhibiting the differentiation of adipocyte cells, for stimulating proliferation of Endowhelm (2) colon, breast, cells, for stimulating proliferation of Endowhelm (2) colon, breast, to stimulating proliferation of Man uncolotide sequences or antisense probes. (1) is also useful as therapeutic agent. PRO is useful in assays to identify other proteins or molecules involved in binding in generation of antisense RNA and DNA, in the preparation of PRO polypeptide, for generating transgenic animals or knockout animals which in turn are useful in the development and screening of therapeutically useful reagents, in gene therapy, for chromosome marker, and for generating cor serum, and for grobes. An anti-(1)-antibody is useful in diagnostic assays for RNO, e.g. probes. An anti-(1)-antibody is useful in diagnostic assays for RNO, e.g. probes. An anti-(1)-antibody is useful in diagnostic assays for RNO, e.g. The invention describes 305 nucleic acids encoding PRO (secreted and

```
The invention describes 305 nucleic acids encoding PRO (secreted and transmembrane) polypeptides (I). (I) is useful for stimulating the release of TNR-alpha from human blood, for modulating the uptake of glucose or FFA by skeletal muscle calls or adipocyte calls, for stimulating the proliferation of or gene expression in pericyte calls, for stimulating the proliferation of or gene expression in pericyte calls, for stimulating the release of proteoglycans from cartilage, for stimulating the proliferation of inner ear utricular supporting calls, the release of a cytokine from pRMC calls, for inhibiting the binding of A-peptide to factor VIIA, for inhibiting the binding of A-peptide to factor VIIA, for inhibiting the differentiation of adipocyte chils, for stimulating proliferation of endothelial calls, for detecting the presence of tumour in a mammal. The tumour is lung, colon, breast, prostate, rectal, cervical or liver tumour. The oligonucleotide probes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; secreted and transmembrane protein; PRO; gene; ss;

Sequence 1129 BP; 231 A; 369 C; 335 G; 194 T; 0 U; 0 Other; a novel human secreted and transmembrane PRO polypeptide.

are useful for isolating genomic and cDNA nucleotide sequences or antisense probes. (I) is also useful as therapeutic agent. PRO is useful in assays to identify other proteins or molecules involved in binding interaction. A polynucleotide (II) encoding (I) is useful in chromosome and gene mapping, in generation of antisense RNA and DNA, in the preparation of PRO polypeptide, for generating transgenic animals or knockout animals which in turn are useful in the development and screening of therapeutically useful reagents, in gene therapy, for chromosome identification, as chromosome marker, and for generating probes. An anti-(I)-antibody is useful in diagnostic assays for PRO, e.g. detecting its expression in specific cells, tissues or serum, and for affinity purification of PRO from recombinant cell culture or natural sources. (I) and (II) are useful in the interaction of the

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the presence of a tumour in a mammal (e.g. adrena), ung, colon, breast, prostate, rectal, kidney, cervical and invertumours). The prolynucleotides are useful in molecular biology, including uses a hybridisation probes, in chromosome and gene mapping, in generating antiennes RNA and brook polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful reagents. The PRO Polypeptides or antibodies are used in preparing a mediament for treating a condition responsive to the polypeptides or antibodies such as tumours, for stimulating and inhibiting proliferation of thuman microvascular endothelial cells, for modulating the uptake of slumman microvascular endothelial cells, for stimulating the proliferation of antibodies, such as tumours, for stimulating and inhibiting proliferation of or gene expression in pericyte cells, for stimulating the proliferation of adipocyte cells, for stimulating edication of adipocyte cells, for stimulating cells, for inducing endothelial cell to mediame to a sports injuries and cells, for articulas edicock as such as sports injuries and returnities and prepared and propaptides which stimulate the release of proteoglycans from carticular cartilage defects, osteoarthritis and rhemmatoid atthrities and prepared contained specific from annowed local immune system cell infilteration. This associated disorders such as various braiassaemias and conditions which sequence encodes a human RRO polypeptide of the invention. Note: The sequence encodes a human RRO polypeptide of the invention. Note: The sequence encodes a human encodes a huma

WPI; 2003-755115/71. P-PSDB; ADA80378.

New PRO polypeptides useful for treating diabetes, hyper- or hypo-insulinemia, sports injuries, arthritis, obesity, stroke, heart attack, various coagulation disorders and tumors.

Claim 2; Fig 221; 638pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for

detecting the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polymucleotides may also be used in preparing PRO polymeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful caseful in the development and screening of therapeutically useful and polymeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polymeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of medicament for treating a condition responsive to the polymeptides or antibodies, such as tumours, for stimulating the uptake of glucose or FPA by skeletal muscle cells, for adipocyte cells, for stimulating the uptake of glucose or FPA by skeletal muscle cells or adipocyte cells, for stimulating the proliferation of or gene expression in periove cells, for stimulating the proliferation of cartilage disorders such as sports injuries and arthritis. PRO polypeptides which estimulate the release of proteoglycans from cartilage are useful for treating sports-related joint problems, arthritis. PRO polypeptides are useful for treating sports-related disorders such as various thalassaemias and conditions which may benefit from enhanced local immune system cell infiltration. This sequence represents a human PRO polymucleotide of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at sequence. The sequence of the invention.

New PRO nucleic acid, useful for preparing a composition for treating

Claim 2, Fig 221; 637pp; English. e.g., tumor or for tissue typing.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the presence of a tumour in a mammal (e.g. adrenal, lung, corolification or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, collon, breast, prostate, rectal, kidney, cervical and liver tumours). The colymucleotides are useful in molecular biology, including uses as hyridisation probes, in chromosome and gene mapping in generating a strissnes RAM and bn gene therapy. The polymucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals and in generating either transgenic animals or knock-out animals and in second section in the development and screening of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of thuman microvascular endothelial cells, for stimulating proliferation of sumer each endipocyte cells, for stimulating proliferation of inner ear utricular supporting cells, for stimulating are useful for treating sports-related joint problems arthitis. PRO polypeptides which stimulate the release of proteoglycans tricular cartilage are useful for treating sports-related joint problems arthitis. PRO polypeptides which stimulate the release of proteoglycans arthitis. PRO polypeptides which stimulate the release of proteoglycans arthitis. PRO polypeptides which stimulate the release of proteoglycans arthitis and insenting sports-related joint problems engletices are also useful for treating various mammalian headened disorder Sequence 1129 BP; 231 A; 369 C; 335 G; 194 T; 0 U; 0 Other; from USPTO at segdata.uspto.gov/seguence.html Conservative Local Similarity nes 31; Conserv Query Match Matches ઠે ò

#### WPI; 2003-644800/61. P-PSDB; ADA46845

New isolated nucleic acid encoding a PRO polypeptide, e.g. PRO1114 or PRO4978, useful in molecular biology, chromosome and gene mapping, in generating antisense RNA and DNA, and in gene therapy.

### Claim 2; Fig 221; 638pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymuclectides encoding them. The invention also relates to an antibody which specifically binds them. The propagatide, a method for stimulating the release of tumour necrosis factor-alpha (TWP-alpha) from human blood, a method for stimulating the proliferation or differentiation of fondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, Kidney, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating on tisense RNA and DNA and in gene therapy. The polymucleotides may also antisense RNA and DNA and in gene therapy. The polymucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing a medicament for treating a-condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation

```
of human microvascular endothelial cells, for modulating the uptake of glucose or FFA by skeletal muscle cells or adipocyte cells, for stimulating differentiation of adipocyte cells, for stimulating proliferation of or gene expression in periote cells, for stimulating the proliferation of inner ear utricular supporting cells or T-lymphocyte cells, for inducing endothelial cell tube formation and for treating various bone and/or cartilage disorders such as sports injuries and articular cartilage are useful for treating sports injuries and articular cartilage defects, oscoarthritis and rheumatoid arthritis. PRO polypeptides which stimulas store are useful for treating various mammalian haemoglobin-associated disorders such as various thalassaemia and conditions which may benefit from enhanced local immune system cell infiltration. This csquence data for this patent is also available in electronic format from USPTO at segdata.uspto.gov/sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; gene; ss; PRO; secreted polypeptide; transmembrane polypeptide; tumour necrosis factor-alpha; TNF-alpha; chondrocyte cell; tumour; cancer; adrenal; lung; colon; breast; prostate; rectum; kidney; cervix; liver; microvascular endothelial cell; glucose; PFA; skeletal muscle cell; adipocyte cell; glucose; PFA; inner ear utricular supporting cell; priorpe cell; endothelial cell tube formation; bone disorder; cartilage disorder; endothelial cell tube formation; bone disorder; cartilage disorder; rheumatoid architis; haemodjobin-associated disorder thalassaemia; immune system cell infiltration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0;

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) From human blood, a method for stimulating the presence of a tumour in a mammal (e.g. adrenal, und, for proliferation or differentiation of chondcrocyte cells and a method for proliferation probes, in chromosome and gene mapping in generating a ratesense RM and bn gene therapy. The polymucleotides may also be used in preparing PRO POLYPEPTION of the polypeptides or antibodies are useful in molecular biology, including uses and in generating either transgent animals or knock-out animals and in generating a the propospection of the polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies are used in preparing of human microvascular endothelial cells, for modulating the uptake of glucose or FRA by skeletal muscle cells, for simulating differentiation of adipocyte cells, for stimulating differentiation of adipocyte cells, for stimulating differentiation of adipocyte cells, for stimulating and preparing expression in pericyte cells, for stimulating and condition stimulating and individual endothelial cell tube formation and for treating various bone and/or cartilage disorders such as sports injunities and cells, for artitulage defected. Setecathritis and rheumatoid arthritis and propules which stimulate the release of proteglycans arthritis. PRO polypeptides which stimulate the release of proteglycans arthritis and rheuman pRO polypeptides are also useful for treating sports called disorders such as various bone and/or setals for minimal sequence represents a human PRO polypeptides are also useful for treating serions of the invention.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               15-MAY-2003.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             05-OCT-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          30-NOV-1999
                                                                                          ADB26666;
RESULT 97
                          ADB26666,
                                                                                       The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, amethod for stimulating the release of tumour necrosis factor-alpha (TMF-alpha) from human blood, a method for stimulating the polyneptide, amethod for chondrooty-cells and amethod for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polynucleotides are useful in molecular biology, including uses as plynucleotides are useful in molecular biology, including uses as colon, breast man probas, in chromosome and gene mapping, in generating enter transgenic antimals or knock-out animals which are useful in the development and screening of therapeutically useful cuseful in the development and screening of therapeutically useful are useful in the development and screening of therapeutically useful cuseful in the development and screening of therapeutically useful readicament for treating a condition responsive to the pulpeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of conference or FRA by skeleral muscle cells, for modulating the uptake of stimulating differentiation of adipocyte cells, for stimulating proliferation of inner ear utricular supporting cells, for stimulating proliferation of inner ear utricular supporting cells, for stimulating cells, for inducing endethelial cell tube formation and for treating carting sports induced disorders such as sports injuries and contilions are useful for treating sports related joint problems. FRO polypeptides which stimulate the release of proteoglycans from cartilage are also useful for treating sorts-related joint problems. Con any benefit from enhanced local immune system cell infilteration. This sequence represents a human PRO polymucleotide of the invention. This consequence in the proliferation of inner ear useful as a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;

WPI; 2003-777249/73. P-PSDB; ADB26667 Novel isolated PRO polypeptide useful for treating diabetes, hyper- or hypo-insulinemia, sports injuries, arthritis, obesity, stroke, heart attack, various coagulation disorders, tumors.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The Claim 2; Fig 221; 660pp; English.

Compeptide, a method for simulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the factor-alpha (TNF-alpha) from human blood, a method for stimulating the prosleder of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polyuncleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and bnX and in gene therapy. The polyuncleotides may also consistent by preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are consecunt in the development and screening of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of human microvascular endothelial cells of adipocyte cells, for stimulating the uptake of stimulating differentiation of adipocyte cells, for stimulating the proliferation of or gene expression in percept cells, for individual cells or T-lymphocyte cells, for individual endothelial cells to the proliferation of siner ear utricular supporting cells, for individual endothelial cells to cells, for individual endothelial cells to sports injuries and cells, for individual endothelial cells to some and/or cartilage disorders such as various bone and/or cartilage disorders such as various benefit for treating various mammalian haemodlobin-cells, for individual endothelial for treating various mammalian haemodlobin-cells, may benefit from enhanced local immune system cell infiltration. This sequence encodes a human PRO polypeptide of the invention. The sequence encodes a human proper various benefit for treating encodes a hu invention also relates to an antibody which specifically binds to the USPTO website at segdata.uspto.gov.

Novel isolated PRO polypeptide useful for treating diabetes, hyper- or hypo-insulinemia, sports injuries, arthritis, obesity, stroke, heart attack, various coagulation disorders, tumors.

Claim 2; Fig 221; 638pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the presence of a tumour in a mammal (e.g. adream). Indice to polypeptide, a method for stimulating the presence of a tumour in a mammal (e.g. adream). Indice to polynucleotides are useful in molecular biology, including uses as polynucleotides are useful in molecular biology, including uses as polynucleotides are useful in molecular biology, including uses as the polymolectides may also a present of the properties by recombinant techniques and in generating either transgenic animals or knock-out animals which are setul in the development and screening of therapeutically useful cagents. The PRO polypeptides or antibodies are used in preparing a temporary for stimulating and inhibiting proliferation of human microvascular endothelial cells, for modulating the uptake of glucose or FPA by skeletal muscle cells, for stimulating differentiation of adipocyte cells, for stimulating confideration of adipocyte cells, for stimulating differentiation of adipocyte cells, for stimulating confideration of adipocyte cells, for stimulating confideration of adipocyte cells, for stimulating and condition cartilage disorders such as sports injuries and remained arthrities propolypeptides which stimulate the release of proteoglycans cartilage defects, osteoarthritis and rheumatoid anthrities propolypeptides which stimulate the release of proteoglycans articular cartilage defects, osteoarthritis and rheumatoid anthrities mannanced coll immune system cell infilteration. Note: The sequence encodes a human PRO polypeptide of the invention. Note: The sequence data for this patent is also available in electronic format format formation.

(GETH ) GENENTECH INC. 

The invention describes 305 nucleic acids encoding PRO (secreted and transmembrane) polypoptides (1). (1) is useful for stimulating the crease of TNF-alpha from human blood, for modulating the uptake of glucose or FFA by skeletal muscle cells or adipocyte cells, for stimulating the proliferation of or gene expression in pericyte cells, for stimulating the proliferation of or gene expression in pericyte cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of T-lymphocyte cells, for stimulating the proliferation of T-lymphocyte cells, for stimulating the proliferation of T-lymphocyte cells, for stimulating the proliferation of T-lymphocyte cells, for stimulating proliferation of endothelial cells, for stimulating the proliferation of endothelial cells, for detecting the release of tumour in a mammal. The tumour is lung, colon, breast, prostate, rectal, cervical or liver tumour. The oligonucleotide probes cells, for stimulating genomic and CDNA nucleotide sequences or artisense probes. (1) is also useful as therapeutic agent. PRO is useful in assays to identify other proteins or molecules involved in binding interaction. A polynucleotide (II) encoding (I) is useful in chromosome concenting of therapeutically useful reagents, in gene therapy, for probes. An anti-(I)-antibody is useful in the development and sorchered in sexpression in specific cells, tissues or servan, and for generating concess. An anti-(I)-antibody is useful in diagnostic assays for PRO, eggenores. (I) and (II) are useful for tissue typing. This sequence encodes a novel human secreted and transmembrane PRO polypeptide. New secreted and transmembrane PRO polypeptide and nucleic acid, useful for manufacturing a medicament for diagnosing or treating tumor. Baker KP, Beresini M, Deforge L, Desnoyers L, Filvaroff E, Ga Gerritsen ME, Goddard A, Godowski PJ, Gurney AL, Sherwood S; Smith V, Stewart TA, Tumas D, Watanabe CK, Wood WI, Zhang Z; Claim 2; Fig 221; 658pp; English 2003-695893/66. 2003-755107/71. WPI; 2003-755107/ P-PSDB; ADA96358. PRO nucleic acid, useful for preparing a composition for treating e.g. tumor or for tissue typing.

Claim 2; Fig 221; 637pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor alpha (TNF-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, clon, breast, prostate, rectal, kidney, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polymucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful cagents. The PRO polypeptides or antibodies are used in preparing a 

medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of the human microvascular endothelial cells, for modulating the uptake of glucose or FFA by skeletal muscle cells of adipocyte cells, for stimulating the uptake of stimulating differentiation of adipocyte cells, for stimulating the proliferation of or gene expression in pericyte cells, for stimulating the proliferation of inner ear utricular supporting cells or T-lymphocyte cells, for inducing endothelial cell tube formation and for treating various bone and/or cartilage disorders such as sports injuries and arthritis. PRO polypeptides which stimulate the release of proteoglycans continular cartilage defects, osteoarthritis and rheumandid arthritis. PRO polypeptides are also useful for treating sports-related joint problems, atticular cartilage defects, osteoarthritis and rheumandid nemoglobin-collypeptides are also useful for treating various mammalian haemoglobin-collypeptides are also useful for treating various mammalian haemoglobin-collypeptides are also useful for treating various mammalian haemoglobin-collypeptides are also useful for treating various mammalian carthritis and conditions which may benefit from enhanced local immune system cell infiltration. This sequence represents a human PRO polypudicolide of the invention. The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polypucleotides encoding them. The invention also relates to an antibody which spedifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TWF-alpha) from human blood, a method for stimulating the release of tumour necrosis of proliferation or differentiation of chondrocyte cells and amended for detecting the presence of a tumour in a mammal (e.g. adremal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The prolymucleotides are useful in molecular biology, in generating to polymucleotides are useful in molecular biology, in generating this statements. The PRO Polypeptides by recombinant techniques and in this sense in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of knock-out animals which are useful in the development and screening of knock-out animals which are useful in the development and screening of knock-out animals which are useful in the development and screening or knock-out animals which are useful in the development and screening or knock-out animals which are useful set undouted as tumours, for stimulating and inhibiting proliferation of matumours, for stimulating and inhibiting proliferation of submore are useful set modulating the uptake of glucose or FPA by skeletal muscle cells, for stimulating differentiation of submore are useful for streating sports injuries and arthritis. PRO polypeptides which stimulate the release of proteoglycans of from cartilage are useful for treating various mammalian hamoglablems, articular cartilage are useful for treating various mammalian hamoglablems, articular cartilage are useful for treating various mammalian made for this patent is also sequence represents a whoman PRO polymorectide of the invention. This sequence represents a whoman PRO polymorectide of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; gene; ss; PRO; secreted polypeptide; transmembrane polypeptide; tumour necrosis factor-alpha; TNF-alpha; chondrocyte cell; tumour; cancer; adrenal; lung; colon; breast; prostate; rectum; kidney; cervix; liver; microvascular endothelial cell; glucose; FPA; skeletal muscle cell; adipocyte cell; pericyte cell; inner ear utricular supporting cell; T-lymphocyte cell; sports in two formation; bone disorder; cartilage disorder; sports injury; proteoglycan; articular cartilage defect; osteoarthritis; rhemmaglobin-associated disorder thalassaemia; immune system cell infiltration.
New PRO nucleic acid, useful for preparing a composition for treating e.g., tumor or for tissue typing.

Gao W; Baker KP, Beresini M, Deforge L, Desnoyers L, Filvaroff E, G Gerritsen ME, Goddard A, Godowski PJ, Gurney AL, Sherwood S; Smith V, Stewart TA, Tumas D, Watanabe CK, Wood WI, Zhang Z;

New isolated PRO polypeptides, useful for treating diabetes, hyper- c hypo-insulinemia, sports injuries, arthritis, obesity, stroke, heart attack, various coagulation disorders and tumors.

# Claim 2; Fig 221; 638pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the presence of a tumour in a mammal (e.g. adrenal, lung, orlynucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polynucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antiparation probes, in dromosome and gene mapping, in generating antiparation properides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of human microvascular endothelial cells, for modulating the uptake of stimulating differentiation of adipocyte cells, for stimulating to proliferation of or gene expression in pericyte cells, for stimulating the proliferation of or gene expression in pericyte cells, for stimulating the proliferation of or gene expression in pericyte cells, for stimulating the proliferation of an endothelial cell tube formation and for treating various bone and/or cartilage disorders such as sports injuries and arthritis. PRO polypeptides which stimulate the release of proteoglycans

```
PRO
from cartilage are useful for treating sports-related joint problems, articular cartilage defects, osteoarthritis and rheumatoid arthritis. PRC polypeptides are also useful for treating various mammalian haemolobin-associated disorders such as various thalassaemias and conditions which may benefit from enhanced local immune system cell infiltration. This sequence represents a human PRO polyuucleotide of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at segdata.uspto.gov/sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; gene; ss; PRO; secreted polypeptide; transmembrane polypeptide; tumour necrosis factor-alpha; TNF-alpha; chondrocyte cell; tumour; cancer; adrenal; lung; colon; breast; prostate; rectum; kidney; cervix; liver; microvascular endothelial cell; glucose; FFA; skeleral muscle cell; adipocyte cell; pericyte cell; inner ear utricular supporting cell; pericyte cell; inner ear utricular supporting cell; T-lymphocyte cell; sports injury; proteoglycan; articular cartilage disorder; sports injury; proteoglycan; articular cartilage defect; osteoarthritis; rheumatoid arthritis, haemoglobin-associated disorder thalassaemia; immune system cell infiltration.

Claim 2; Fig 221; 659pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the prostering the presence of a tumour in a memmal (e.g. adrenal, lung, certorical and invention and method for opportunities are useful in molecular blooky, including uses as polymucleotides are useful in molecular blooky, including uses as polymucleotides are useful in molecular blooky, including uses as polymucleotides are useful in molecular blooky, including uses as polymucleotides are useful in gene therapy. The polymucleotides may also arisanse RNA and BNA and in gene therapy. The polymucleotides may also be used in preparing RNA polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapputically useful transpenses. The RRO polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or antibodies are used in preparing of human microvascular endothelial cells, for modulating the uptake of glucese or FRA by skeletal muscle cells, for stimulating differentiation of adipocyte cells, for stimulating differentiation of alphocyte cells, for stimulating and condition screens of inner ear utricular supporting cells or T-lymphocyte cells, for stimulating and condition and cells or adipocyte cells, for stimulating and cells or the proliferation of anothalial cell tube formation and for treating cartings are useful for treating various mammalian hammed conditions which proliferates are useful for treating various mammalian hamped condition associated disorders such as various thalasseamias and condition. Note: The sequence data for this patent is also available in electronic format from the patent of the useful for treating various mamm

Gao W;

The invention describes 305 nucleic acids encoding PRO (secreted and transmembrane) polypeptides (I). (I) is useful for stimulating the release of TNF alpha from human blood, for modulating the uptake of glucose or FNA by skeletal muscle cells or adjocyte cells, for stimulating the proliferation or differentiation of chondrocyte cells, for stimulating the proliferation of or gene expression in pericyte cells, for stimulating the release of proteoglycans from cartilage, for stimulating the proliferation of inner ear utifular supporting cells, for stimulating the proliferation of Inner ear utifular supporting cells, for stimulating the release of a cytokine from PBMC cells, for inhibiting the binding of peptide to factor VIIA, for inhibiting the differentiation of adipocyte cells, for stimulating the proliferation of endothelial cells, for detecting the presence of tumour in a mammal. The tumour is lung, colon, breast,

2000WO-US006319 2000WO-US006884

prostate, rectal, cervical or liver tumour. The oligonucleotide probes are useful for isolating genomic and cDMA nucleotide sequences or antisense probes. (I) is also useful as therapeutic agent. PRO is useful in assays to identify other proteins or molecules involved in binding interaction. A polymucleotide (II) encoding (I) is useful in chromosome and gene mapping, in generation of antisense RNA and DNA, in the preparation of PRO polypeptide, for generating transgenic animals or knockout animals which in turn are useful in the development and sor chromosome identification, as chromosome marker, and for generating probes. An anti-(I)-antibody is useful in diagnostic assays for PRO, e.g. detecting its expression in specific cells, tissues or serum, and for affinity purification of PRO from recombinant cell culture or natural sources. (I) and (II) are useful for tissue typing. This sequence encodes a novel human secreted and transmembrane PRO polypeptide. ö 0; Gaps TICTTAATTTTTCATTTCCAGATTTCCTTCAGTTTGGGTTTTGTTT 1881 DB 1; Length 1129; Sequence 1129 BP; 231 A; 369 C; 335 G; 194 T; 0 U; 0 Other; Query Match 1.1%; Score 21.4; DB 1; Length 1 Best Local Similarity 66.0%; Pred. ```
The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TWF-alpha) from human blood, a method for stimulating the poliferation or differentiation of chondrocyte cells and a method for proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adremal, lung, collon, breast, prostate, rectal, kidney, cervical and liver tumours). The colymucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and in gene therapy. The polymucleotides may also cantisense RNA and propositides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the Gevelopment and screening of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of inner endothelial cells, for simulating differentiation of adipocyte cells, for stimulating proliferation of inner ear unicular supporting cells. for inducing endothelial cell tube formation and for treating proliferation of adipocyte cells, for stimulating and prelamination and adipocyte cells, for inducing endothelial cell tube formation and for treating various bone and/or cartilage defects, escenathatics and rheamatoid attrities PRO polypeptides which stimulate the release of proteoglycans arthities. PRO polypeptides which stimulate the release of proteoglycans arthities are also useful for treating sports-related joint problems, arthities are also useful for treating various manmallan hamoglobin-may benefit from enhanced local immune system cells in the propertion of the manned
                                                                                                                                                                                                                                                                                                                                                                                                       Novel isolated, secreted and transmembrane PRO polypeptides e.g. PRO1801 and PRO1114, useful in the preparation of a medicament for treating a condition responsive to PRO polypeptide, and as therapeutic agents e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 2; Fig 221; 659pp; English.

WPI; 2003-755065/71. P-PSDB; ADB18119 New secreted and transmembrane PRO polypeptides and nucleic acids, usef in gene therapy, in chromosome and gene mapping, as chromosome markers, in tissue typing, and in identifying chromosomes.

Claim 2; Fig 221; 637pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polypucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the presence of a tumour in a mammal (e.g. adrenal, lung, cloif prast, prostate, rectal, kidney, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polymucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful medicament for treating a condition responsive to the polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies. Such as tumours, for stimulating and inhibiting proliferation of plucose or FRA by skeletal muscle cells, for stimulating che uptake of glucose or FRA by skeletal muscle cells or adipocyte cells, for stimulating the proliferation of or gene exporting cells or T-lymphocyte cells, for stimulating the proliferation of inner ear uniticular supporting cells or T-lymphocyte cells, for stimulating the proliferation and inner ear uniticular supporting cells or T-lymphocyte cells, for stimulating the cells, for stimulating the proliferation of inner ear uniticular supporting cells or T-lymphocyte cells, for stimulating the cells, for stimulating the medicament cells in the proliferation of inner ear uniticular supporting cells or T-lymphocyte cells, for stimulating the cells, for stimulating cells or medicament cells, for stimulating cells or medicament cells, for stimulating cells or cells, cells, cells, cells, cells, cells, cells, cells, cells, cells, cells,

                     arthritis. PRO polypeptides which stimulate the release of proteoglycans from cartilage are useful for treating sports-related joint problems. Atticular cartilage defects, osteoarthritis and rheumatoid arthritis. PRO polypeptides are also useful for treating various mammalian heemoglobin-associated disorders such as various thalassaemias and conditions which may benefit from enhanced local immune system cell infiltration. This sequence encodes a human PRO polypeptide of the invention. Note: The sequence data for this patent is also available in electronic format from the USPTO website at segdata.uspto.gov.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PRO polypeptide,

release of TNP-alpha from human blood, for modulating the uptake of glucose or FPA by skeletal muscle cells or adipocyte cells, for stimulating the proliferation or differentiation of chondrocyte cells, for stimulating the proliferation of or gene expression in pericyte cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating proliferation of T-lymphocyte cells, for stimulating proliferation of For inhibiting the binding of A-peptide to factor VIIA, for inhibiting the differentiation of adipocyte cells, for stimulating proliferation of module is lung, colon, breast, the presence of tumour in a mammal. The tumour is lung, colon, breast, prostate, rectal, cervical or liver tumour. The oligomucleotide probes care useful for isolating genomic and cDNA nucleotide sequences or antisense probes. (I) is also useful as therapeutic agent. PRO is useful in therapeutic and promosome and adminible or properation of PRO polypeptide, for generating transgenic animals or knockout animals which in turn are useful in the development and screening of therapeutically useful reagents, in gene therapy, for chromosome identification, as chromosome marker, and for generating probes. An anti-(I)-antibody is useful in diagnostic assays. for PRO, esgreecting type sexpression in specific cells, tissues or serum, and for affinity purification of PRO from recombinant cell culture or natural sources. (I) and (II) are useful for tissue typing. This sequence encodes

The invention describes 30b nucleic acids encoding PRO (secreted and transmembrane) polypeptides (1). (1) is useful for stimulating the uptake of release of TNF-alpha from human blood, for modulating the uptake of glucose or FRA by skeletal muscle cells or adjocyte cells, for stimulating the proliferation or differentiation of chondrocyte cells, for stimulating the proliferation of or gene expression in periorte cells, for stimulating the proliferation of or gene expression in periorte cells, for stimulating the proliferation of T-lymphocyte cells, for stimulating the proliferation of T-lymphocyte cells, for stimulating the proliferation of T-lymphocyte cells, for stimulating the proliferation of T-lymphocyte cells, for stimulating of C A-peptide to factor VIIA, for inhibiting the binding of C A-peptide to factor VIIA, for inhibiting the binding of the presence of tumour in a mammal. The tumour is lung, colon, breast, cells, for stimulating genomic and cDNA nucleotide sequences or prostate, rectal, cervical or liver tumour. The oligonucleotide probes are useful for isolating genomic and cDNA nucleotide sequences or antisense probes. (1) is also useful as therapeutic agent. PRO is useful in assays to identify other proteins or molecules involved in binding in assays to identify other proteins or molecules involved in binding in assays to identify other proteins or generating transgenic animals or screening of therapeutically useful reagents, in gene therapy, for knockout animals which in turn are useful in diagnostic assays for pRO, ergorbes. An anti-(1)-antibody is useful in diagnostic assays for pRO, ergorbes. The antibody is useful in diagnostic assays for pRO, ergorbes. The antibody is useful in diagnostic assays for pRO, ergorbes. The and (II) are useful for tissue typing. This sequence encodes a novel human secreted and transmembrane PRO polypeptide.
                                                                                                                                                                                                                                                                                   invention describes 305 nucleic acids encoding PRO (secreted and

New PRO nucleic acid, useful for preparing a composition for treating e.g., tumor

Claim 2; Fig 221; 200pp; English.

The invention describes 305 nucleic acids encoding PRO (secreted and transmembrane) polypeptides (I). (I) is useful for stimulating the transmembrane of TNT-alpha from human blood, for modulating the uptake of glucose or FPA by skeletal muscle cells or adipocyte cells, for glucose or FPA by skeletal muscle cells or adipocyte cells, for stimulating the proliferation of or gene expression in pericyte cells, for stimulating the proliferation of proteoglycans from cartilage, for stimulating the proliferation of Tlymphocyte cells, for stimulating the proliferation of for 1 proportion of adipocyte cells, for stimulating the proliferation of Flymphocyte cells, for stimulating the proliferation of Flymphocyte cells, for stimulating of the release of a cytokine from PBMC cells, for inhibiting the binding of the release of two function in a mammal. The differentiation of adipocyte cells, for stimulating proliferation of endothelial cells, for detecting the presence of tumour in a mammal. The tumour is lung, colon, breast, cells, for solating genomic and cDNA nucleotide sequences or are useful for isolating genomic and cDNA nucleotide sequences or contisense probes. (I) is also useful as therapeutic agent. PRO is useful in assays to identify other proteins or molecules involved in binding in assays to identify other proteins or molecules involved in binding conditions of proparation of PRO polypeptide, for generating transgenic animals or knockout animals which in turn are useful in the development and conforming of therapeutically useful reagents, in gene therapy, for chromosome identification, as chromosome marker, and for generating conforming its expression in as chromosome marker, and for generating conforming its expression in specific cells, tissues or serum, and for affinity purification of PRO from recombinant cell culture or natural confinition and transmembrane PRO polypeptide.

claim 2, Fig 221; 637pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TMF-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polynucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating

57.

cc antisense RNA and DNA and in gene therapy. The polymucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in cgenerating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or conditions. For stimulating and inhibiting proliferation of antibodies, such as tumours, for stimulating and inhibiting proliferation of human microvascular endothelial cells, for modularing the uptake of glucose or FFA by skeletal muscle cells, for stimulating colliferation of or gene expression in pericyte cells, for stimulating proliferation of or gene expression in pericyte cells, for stimulating colliferation of or gene expression in pericyte cells, for stimulating colliferation of or gene expression in pericyte cells, for stimulating colliferation of or gene expression in pericyte cells, for treating cells, for stimulating cells, for stimulating cells, for stimulating cells, for stimulating cells, for treating endothelial cell tube formation and for treating cells, for arthritis and for treating sports injuries and arthritis. PRO polypeptides which stimulate the release of proteoglycans creativals are also useful for treating various mammalian haemoglobin—associated discorders such as various thalasseamias and conditions which may benefit from enhanced local immune system cell infiltration. This sequence encodes a human PRO polypeptide of the invention. Note: The condition wheels at seadars and conditions was from the strong format from the form wheels a service is also available in electronic format from the form wheels and the propertions of the propertion of the propertion of the propertion of the propertion of the propertion of the propertion of the propertion of the propertion of the propertion of the propertion of the propertion of the propertion of the propertion of the propertion of th ô Human; gene; ss; PRO; secreted polypeptide; transmembrane polypeptide; tummour necrosis factor-alpha; TNF-alpha; chondrocyte cell; tummour; cancer; aderanl; hung; colon; break; prostate; rectum; kidney; cervix; liver; microvascular endothelial cell; glucose; FFA; skeletal muscle cell; adipocyte cell; glucose; FFA; endothelial cell; adipocyte cell; pericyte cell; endothelial cell tube formation; bone disorder; cartilage disorder; sports injury; proteoglycan; articular cartilage defect; osteoarthritis; rheumatoid arthritis; hemoglobin-associated disorder thalassaemia; immune system cell infiltration. New secreted and transmembrane nucleic acids and polypeptides, designated as PRO, useful for treating inflammation, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, or cancer.

Claim 2; Fig 221; 660pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymuclectides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for a timulating the release of tumour necrosis factor-alpha (TNR-alpha) from human blood, a method for stimulating the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostent, kidney, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polymucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of human microvascular endothelial cells, for modulating the uptake of glucose or FRA by skeletal muscle cells or addipocyte cells, for

stimulating differentiation of adipocyte cells, for stimulating proliferation of or gene expression in pericyte cells, for stimulating the proliferation of inner ear utricular supporting cells or T-lymphocyte cells, for inducing endothelial cell tube formation and for treating various bone and/or cartilage disorders such as sports injuries and arthritis. PRO polypeptides which stimulate the release of proteoglycans from cartilage are useful for treating sports-related joint problems, polypeptides are also useful for treating various mammalian hamoglobin-polypeptides are also useful for treating various mammalian hamoglobin-associated disorders such as various thalassaemias and conditions which may benefit from enhanced local immune system cell infiltration. This sequence represents a human PRO polymucleotide of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; secreted and transmembrane protein; PRO; gene; ss; Tumour necrosis factor alpha release; TNF-alpha release; glucose uptake modulator; prA uptake modulator; cell proliferation stimulator; cell differentiation stimulator; cell differentiation stimulator; cytokine release stimulator; tumour; lung tumoue; colon tumour; breast tumour; prostate tumour; rectal tumour; cervical tumour; ilver tumour; chromosome mapping; gene mapping; gene therapy; chromosome identification; chromosome marker.

P-PSDB; ADA88457.

New secreted and transmembrane PRO polypeptides and nucleic acids, useful in gene therapy, detecting the presence of tumor in a mammal, or modulating the uptake of glucose or free fatty acid by skeletal muscle cells or adipocyte cells.

Claim 2; Fig 221; 659pp; English.

transmembrane) polypeptides (1). (1) is useful for stimulating the transmembrane) polypeptides (1). (1) is useful for stimulating the grake of graducose or FFRA by skeletal muscle cells or adipocyte cells, for stimulating the proliferation of or game expression in pericyte cells, for stimulating the proliferation of or game expression in pericyte cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of -lymphocyte cells, for stimulating the binding of A-peptide to factor VIIA, for inhibiting the differentiation of adipocyte cells, for stimulating graducon of endothelial cells, for detecting the presence of tumour in amamal. The tumour is lung, colon, breast, prostate, rectal, cervical or liver tumour is lung, colon, breast, prostate, rectal, cervical or liver tumour is lung, colon, breast, prostate, rectal, cervical or liver tumour is lung, colon, breast, prostate, rectal, cervical or liver tumour is lung, colon, breast, prostate, rectal, cervical or liver tumour is lung, colon, breast, prostate, rectal, cervical or liver tumour is lung, colon, breast, prostate, rectal, cervical or liver tumour is lung, colon, breast, prostate, colon, breast, prostate, or identify other proteins or molecules involved in binding in theraction of PRO polypeptide, for generating transgent and consone administration, as dhromosome ladentification, as chromosome marker, and for generating probastically undered and generating probes. An anti-(1)-antibody is useful in diagnostic assays for PRO, ergoneres. (1) and (11) are useful in diagnostic assays for prodessing probes. An anti-(1)-antibody is useful in diagnostic assays for matural sources. (1) and (11) are useful for tissue typing replaced encodes (I) and (II) are useful for tissue typing. This sequence encodes novel human secreted and transmembrane PRO polypeptide.

2003-755106/71. P-PSDB; ADA97462. Isolated nucleic acid encoding a PRO polypeptide, e.g. PRO1114 or PRO4978, useful in molecular biology, chromosome and gene mapping, in generating antisense RNA and DNA, and in gene therapy.

Claim 2; Fig 221; 666pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an attibody which specifically binds to a PRO polypeptide, a method for stimulating the invention also relates to an attibody which specifically binds to a PRO polypeptide, a method for stimulating the presence of a tumour in a memmal (e.g. adremal, lung, corol, breast, prostate, rectal, kidney, cervical and liver tumours). The prolynucleotides are useful in mclecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and BNA and in Gene therapy. The polyuncleotides may also constrained the transgenic animals or knock-out animals which are useful in the development and screening of knock-out animals which are useful in the development and screening of knock-out animals which are useful in the development and screening of knock-out animals which are useful in the development and screening of knock-out animals which are useful in the development and screening of knock-out animals which are useful in the development and screening of knock-out animals which are useful in the development of condition are proposition of the proliferation of or stimulating and inhibiting proliferation of human microvascular endothelial cells, for mediating the uptake of stimulating differentiation of adipocyte cells, for stimulating the proliferation of or gene expression in periore cells, for stimulating and carting endothelial cells or adipocyte cells, for stimulating the proliferation of since are utridual responsive or like proliferation of or gene expression in periore cells, for stimulating are useful for treating sports injuries and articular cartilage are useful for treating sports related joint problems, articular cartilage are useful for treating sports. related joint problems, articular cartilage are useful for treating sports. related joint problems, articular as busness of propertice or sequence repr
